WGU Managing Cloud Security (JY02) Sample Questions (Q11-Q16):

NEW QUESTION # 11

Which of the following is an iterative software development methodology that focuses on achieving customer satisfaction by delivering the software early in the process and welcoming changing requirements from the customer, even late in the process?

- A. Lean
- B. Waterfall
- C. Agile
- D. Spiral

Answer: C

Explanation:

Agile is an iterative software development methodology designed to prioritize customer satisfaction, adaptability, and incremental delivery. Agile teams deliver small, working pieces of software frequently, ensuring feedback is incorporated throughout the process. This flexibility allows late-stage requirement changes to be accommodated without derailing the project.

Waterfall is a sequential approach with limited flexibility. Spiral combines iterative development with risk analysis, but it is not as customer-focused as Agile. Lean emphasizes efficiency and waste reduction but does not center on continuous delivery and adaptability.

Agile frameworks such as Scrum and Kanban embody this philosophy, supporting faster innovation, better collaboration, and responsiveness to evolving business needs.

NEW QUESTION # 12

A group of DevOps engineers adopted the network-as-code methodology to manage network infrastructure.

During a code release, the engineers find a bug that is causing issues on a production site. Which safeguard will allow the engineers to restore functionality to the production site?

- A. Rollback
- B. Code testing
- C. Code review
- D. Staging

Answer: A

Explanation:

A rollback is the safeguard that restores a system to its previous, stable state when a new code release introduces issues. In DevOps workflows, rollbacks provide a rapid recovery mechanism, reducing downtime and minimizing customer impact.

Staging, code review, and testing are preventive controls that reduce the likelihood of defects reaching production, but once a bug has already been deployed, rollback is the corrective control.

Rollback strategies often rely on version control systems, container orchestration, or infrastructure-as-code automation to quickly revert to earlier configurations. This practice is essential for maintaining reliability and availability, especially in cloud environments with continuous deployment pipelines.

NEW QUESTION # 13

Developers need to be aware of a common application programming interface (API) threat that occurs when attackers send malicious code through a form input to a web application so that it may then be executed.

Which type of attack represents this API threat?

- A. On-path
- B. Credential
- **C. Injection**
- D. Denial-of-service

Answer: C

Explanation:

The described scenario is an injection attack. Injection occurs when unvalidated input—such as SQL commands, script code, or OS instructions—is sent to an application through API forms or parameters. If the application fails to sanitize input, the attacker's code may be executed with full system privileges.

On-path attacks intercept communication, credential attacks target authentication, and denial-of-service floods services. None involve code execution via unvalidated input.

Injection is a top risk in OWASP API Security Top 10. Developers must implement input validation, parameterized queries, and least privilege principles to mitigate this risk. API gateways and WAFs provide additional layers of protection but cannot replace secure coding practices.

NEW QUESTION # 14

An organization experienced an unplanned event. As a result, the customers using the web application face a loss of service. What does the incident generated in this situation seek to resolve?

- **A. Disruption**
- B. Bug
- C. Change
- D. Error

Answer: A

Explanation:

The unplanned event described is a disruption of service. In IT service management frameworks like ITIL, disruptions occur when an incident prevents normal service delivery. The goal of incident management is to restore service quickly and minimize impact on customers.

A bug refers to a software defect, which may cause disruptions but is not synonymous with the event itself.

An error represents a fault, while change refers to deliberate modifications. Only disruption captures the unplanned nature of service unavailability.

Recognizing incidents as disruptions helps organizations apply structured processes such as escalation, root-cause analysis, and communication. It ensures resilience in cloud-based environments where uptime is a key performance indicator and customer trust is closely tied to availability.

NEW QUESTION # 15

An organization is sharing personal information that is defined in its privacy policy with a trusted third party. What else should the organization communicate to the trusted third party about the personal information?

- **A. The organization's privacy policy and handling practices**
- B. A copy of federal privacy laws regarding unauthorized data disclosure
- C. The results of the organization's most recent privacy audit
- D. A notice of any contractual obligations that do not align with the privacy policy

Answer: A

Explanation:

When sharing personal data with a trusted third party, organizations must ensure that the recipient understands and adheres to the organization's privacy policy and handling practices. This ensures consistent treatment of personal information across entities and aligns with consent provided by individuals.

Audit results and contractual notices are internal matters, while federal laws define obligations but do not substitute for organizational policies. By explicitly sharing policies and practices, organizations reinforce accountability and ensure compliance with privacy regulations such as GDPR, HIPAA, or CCPA.

This communication sets expectations for data use, retention, and disclosure. It also provides a defensible framework in case of regulatory inquiries, showing that due diligence was performed when transferring data to third parties.
