WGU Managing-Cloud-Security – Prepare With Actual Managing-Cloud-Security Exam Questions [2025]

The Managing-Cloud-Security software supports the MS operating system and can simulate the real test environment. In addition, the Managing-Cloud-Security software has a variety of self-learning and self-assessment functions to test learning outcome, which will help you increase confidence to pass exam. The contents of the three versions are the same. Each of them neither limits the number of devices used or the number of users at the same time. You can choose according to your needs. Managing-Cloud-Security Study Materials provide 365 days of free updates, you do not have to worry about what you missed.

WGU Managing Cloud Security (JY02) Sample Questions (Q47-Q52):

NEW QUESTION # 47
Which device is used to create and manage encryption keys used for data transmission in a cloud-based environment?

- A. RAID controller
- B. Hardware security module (HSM)
- C. Memory controller
- D. Trusted platform module (TPM)

Answer: B

Explanation:
A Hardware Security Module (HSM) is a dedicated, tamper-resistant device designed for creating, managing, and storing encryption keys. In cloud environments, HSMs are essential for securing cryptographic operations, such as SSL/TLS key management, digital signatures, and secure data transmission.
TPMs are hardware chips used to secure local devices, such as laptops. Memory controllers and RAID controllers manage system performance and storage but are not cryptographic devices.
HSMs provide strong protection against key theft or misuse by isolating cryptographic functions from general- purpose computing resources. They are often certified under standards like FIPS 140-2, ensuring compliance with stringent security requirements. In cloud services, customers can use provider-managed HSMs or deploy dedicated virtual HSM instances for secure key management.

NEW QUESTION # 48
Which section of a contract includes the customer's right to audit the vendor to verify whether the vendor is fulfilling its contractual obligations?

- A. Indemnification
- B. Termination
- C. Assurance
- D. Litigation

Answer: C

Explanation:
The Assurance section of a contract specifies the customer's rights to verify that the vendor is meeting contractual and compliance obligations. This often includes the right to audit, request independent certifications, or require compliance reports such as SOC 2 or ISO 27001.
Indemnification deals with liability coverage, termination outlines exit conditions, and litigation describes dispute resolution mechanisms. None of these provide the customer with ongoing oversight rights.
Audit rights are critical in cloud contracts to maintain transparency, enforce accountability, and verify that shared responsibility is being upheld. Assurance provisions give customers confidence in the provider's security and operational practices, ensuring compliance with industry regulations.

NEW QUESTION # 49
Which privacy issue does the Clarifying Lawful Overseas Use of Data (CLOUD) Act address?

- A. Collection and use of genetic information
- B. Data breach notification requirements
- C. Use of digital surveillance by multinational employers
- D. Conflicting regulations in different jurisdictions

Answer: D

Explanation:
TheCLOUD Actaddresses conflicts that arise when law enforcement in one jurisdiction seeks access to data stored in another country. It clarifies how U.S. authorities can compel cloud providers to produce data, even if stored overseas, and establishes a framework for resolving jurisdictional conflicts through bilateral agreements.
The Act does not regulate genetic data, breach notifications, or employer surveillance. Its central purpose is to handle the challenge of cross-border data access in the era of globalized cloud computing.
For organizations, this means carefully evaluating how and where data is stored, and ensuring contracts and compliance strategies account for potential conflicts between U.S. law and foreign privacy regulations like GDPR. Awareness of CLOUD Act obligations is crucial in multinational cloud deployments.

NEW QUESTION # 50
Which type of data sanitization should be used to destroy data on a USB thumb drive while keeping the drive intact?

- A. Physical destruction
- B. Key revocation
- C. Overwriting
- D. Degaussing

Answer: C

Explanation:
The correct approach for sanitizing a USB thumb drive while preserving its usability isoverwriting.
Overwriting involves replacing the existing data on the device with random data or specific patterns to ensure that the original information cannot be recovered. This process leaves the physical device intact, allowing it to be reused securely.
Physical destruction, such as shredding, renders the device unusable. Degaussing only works on magnetic media like hard disks or tapes, not on solid-state or flash-based USB drives. Key revocation applies to cryptographic keys and not to physical devices.
By using overwriting, organizations comply with data sanitization standards while balancing operational efficiency. Many tools exist that perform multi-pass overwrites to meet regulatory requirements such as those from NIST or ISO. This ensures that sensitive data is removed while allowing the device to remain in circulation for continued use.

NEW QUESTION # 51
A customer service representative needs to verify a customer's private information, but the representative does not need to see all the information. Which technique should the service provider use to protect the privacy of the customer?

- A. Hashing
- B. Encryption
- C. Tokenization
- D. Masking

Answer: D

Explanation:
Data maskingis a privacy-preserving technique that replaces sensitive fields with obfuscated or partial values while retaining usability. For example, displaying only the last four digits of a Social Security Number or credit card number. This allows a representative to verify identity without accessing the full data set.
Hashing and encryption protect data at rest or in transit, but they do not allow selective partial display.
Tokenization substitutes sensitive data with unique tokens but is typically used for storage and processing rather than interactive verification. Masking, on the other hand, is specifically designed for scenarios where a user must work with limited but recognizable data.
By using masking, organizations enforce the principle of least privilege, reduce exposure of sensitive information, and align with privacy standards such as PCI DSS and GDPR.
