Why our N10-009 exam questions are the most popular in this field? On the one hand, according to the statistics from the feedback of all of our customers, the pass rate among our customers who prepared for the N10-009 exam with the help of our N10-009 guide torrent has reached as high as 98% to 100%. On the other hand, the simulation test is available in our software version of our N10-009 Exam Questions, which is useful for you to get accustomed to the N10-009 exam atmosphere. Please believe us that our N10-009 torrent question is the best choice for you.

No doubt CompTIA N10-009 exam practice test questions are the recommended CompTIA Network+ Certification Exam N10-009 exam preparation resources that make the CompTIA N10-009 exam preparation simple and easiest. To do this you need to download updated and real N10-009 exam questions which you can get from the ValidVCE platform easily. At the ValidVCE you can easily download valid, updated, and real N10-009 Exam Practice questions. All these CompTIA N10-009 PDF Dumps are verified and recommended by qualified CompTIA N10-009 exam trainers. So you rest assured that with the CompTIA N10-009 exam real questions you will get everything that you need to prepare, learn and pass the difficult CompTIA N10-009 exam with confidence.

Keep making progress is a very good thing for all people. If you try your best to improve yourself continuously, you will that you will harvest a lot, including money, happiness and a good job and so on. The N10-009 preparation exam from our company will help you keep making progress. Choosing our N10-009 Study Material, you will find that it will be very easy for you to overcome your shortcomings and become a persistent person. Just come and buy our N10-009 learning guide!

CompTIA Network+ Certification Exam Sample Questions (Q201-Q206):

NEW QUESTION # 201

A network administrator wants to configure a backup route in case the primary route fails. A dynamic routing protocol is not installed on the router. Which of the following routing features should the administrator choose to accomplish this task?

- A. Neighbor adjacency
- B. Administrative distance
- C. Hop count
- D. Link state flooding

Answer: B

Explanation:

Introduction to Administrative Distance

Administrative distance (AD) is a value used by routers to rank routes from different routing protocols. AD represents the trustworthiness of the source of the route. Lower AD values are more preferred. If a router has multiple routes to a destination from different sources, it will choose the route with the lowest AD.

Static Routes and Backup Routes

When a dynamic routing protocol is not used, static routes can be employed. Static routes are manually configured routes. To ensure a backup route, multiple static routes to the same destination can be configured with different AD values.

Configuring Static Routes with Administrative Distance

The primary route is configured with a lower AD value, making it the preferred route. The backup route is configured with a higher AD value. In the event of the primary route failure, the router will then use the backup route.

Example Configuration:

plaintext

Copy code

```
ip route 192.168.1.0 255.255.255.0 10.0.0.1 1
```

```
ip route 192.168.1.0 255.255.255.0 10.0.0.2 10
```

In the above example, 192.168.1.0/24 is the destination network.

10.0.0.1 is the next-hop IP address for the primary route with an AD of 1.

10.0.0.2 is the next-hop IP address for the backup route with an AD of 10.

Verification:

After configuration, use the show ip route command to verify that the primary route is in use and the backup route is listed as a candidate for use if the primary route fails.

CompTIA Network+ guide explains the concept of administrative distance and its use in static routing configuration (see page Ref 9basic Configuration Commands).

NEW QUESTION # 202

A systems administrator is investigating why users cannot reach a Linux web server with a browser but can ping the server IP. The server is online, the web server process is running, and the link to the switch is up. Which of the following commands should the administrator run on the server first?

- A. arp
- B. tcpdump
- C. traceroute
- D. netstat

Answer: D

Explanation:

The netstat command provides information about network connections, routing tables, interface statistics, masquerade connections, and multicast memberships. Running netstat on the server can help the administrator verify that the web server process is listening on the expected port (e.g., port 80 for HTTP or port 443 for HTTPS) and that there are no issues with network connections. This is a crucial first step in diagnosing why the web server is not accessible via a browser.

NEW QUESTION # 203

Which of the following is a characteristic of the application layer?

- A. It performs address translation.
- B. It relies upon other layers for packet delivery.
OB. It checks independently for packet loss.
- C. It encrypts data in transit.

Answer: B

Explanation:

Introduction to OSI Model:

The OSI model is a conceptual framework used to understand network interactions in seven layers: Physical, Data Link, Network, Transport, Session, Presentation, and Application.

Application Layer:

The application layer (Layer 7) is the topmost layer in the OSI model. It provides network services directly to end-user applications.

This layer facilitates communication between software applications and lower layers of the network protocol stack.

Reliance on Other Layers:

The application layer relies on the transport layer (Layer 4) for data transfer across the network. The transport layer ensures reliable data delivery through protocols like TCP and UDP.

The network layer (Layer 3) is responsible for routing packets to their destination.

The data link layer (Layer 2) handles node-to-node data transfer and error detection.

The physical layer (Layer 1) deals with the physical connection between devices.

Explanation of the Options:

A . It relies upon other layers for packet delivery: This is correct. The application layer depends on the lower layers (transport, network, data link, and physical) for the actual delivery of data packets.

B . It checks independently for packet loss: This is incorrect. Packet loss detection is typically handled by the transport layer (e.g., TCP).

C . It encrypts data in transit: This is incorrect. Encryption is typically handled by the presentation layer or at the transport layer (e.g., TLS/SSL).

D . It performs address translation: This is incorrect. Address translation is performed by the network layer (e.g., NAT).

Conclusion:

The application layer's primary role is to interface with the end-user applications and ensure that data is correctly presented to the user. It relies on the underlying layers to manage the actual data transport and delivery processes.

NEW QUESTION # 204

A network architect is implementing an off-premises computing facility and needs to ensure that operations will not be impacted by major outages. Which of the following should the architect consider?

- A. Active-passive approach
- B. DCI
- C. Direct Connect
- **D. Hot site**

Answer: D

Explanation:

A hot site is a fully operational backup facility with hardware, network, and data synchronization already in place. It allows for immediate failover in the event of a disaster, minimizing downtime.

* B. DCI (Data Center Interconnect) connects data centers but doesn't guarantee availability unless built redundantly.

* C. Direct Connect refers to a private link to cloud providers, not disaster recovery.

* D. Active-passive can help with failover but may involve delay unless combined with hot site principles.

NEW QUESTION # 205

A company discovers on video surveillance recordings that an unauthorized person installed a rogue access point in its secure facility. Which of the following allowed the unauthorized person to do this?

- A. Honeytrap
- **B. Tailgating**
- C. Evil twin
- D. Wardriving

Answer: B

Explanation:

Tailgating is a physical security breach where someone follows an authorized person into a restricted area without proper credentials. Once inside, the attacker can install rogue devices like unauthorized APs.

* A. Evil twin is a wireless attack where an attacker sets up a fake AP.

* B. Honeytrap is used to attract attackers for analysis.

* C. Wardriving involves scanning for unsecured Wi-Fi networks while driving, not physical intrusion.
