

NCP-DB Dumps und Test Überprüfungen sind die beste Wahl für Ihre Nutanix NCP-DB Testvorbereitung

Die echten und originalen Prüfungsfragen und Antworten zu NCP-DB (Nutanix Certified Professional - Database Automation (NCP-DB) v6.5) bei Fast2test wurden verfasst von unseren Nutanix-Experten mit den Informationen von NCP-DB (Nutanix Certified Professional - Database Automation (NCP-DB) v6.5) aus dem Testcenter wie PROMETRIC oder VUE.

Nutanix NCP-DB Prüfungsplan:

Thema	Einzelheiten
Thema 1	• Operate and Maintain an NDB Environment: Application of procedural concepts to register database server, provision databases, and test and publish database patches. Additionally, the topic explains the right method to apply Linux OS patches. Lastly, it delves into databases and troubleshooting of NDB operations.
Thema 2	• Describe NDB Concepts: It defines database and NDB terminology. The topic also explains benefits and features of NDB.
Thema 3	• Administer an NDB Environment: While focusing on the administration of an NDB environment, this topic focuses on managing NDB profiles, applying procedural concepts, and managing networks in NDB. Lastly, the topic explains sub-topics of managing access controls in NDB and identifying how to use NDB APIs and CLI.

Heutzutage, wo Zeit in dieser Gesellschaft sehr geschätzt wird, schlage ich Ihnen vor, die effizienten Nutanix NCP-DB (Nutanix

Certified Professional - Database Automation (NCP-DB) v6.5) Fragenkataloge von Fast2test zu wählen. Sie können mit weniger Zeit und Geld die Nutanix NCP-DB Zertifizierungsprüfung nur einmalig bestehen können.

Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 NCP-DB Prüfungsfragen mit Lösungen (Q135-Q140):

135. Frage

Which Time Machine feature allows developers to automate the data refresh for their clones?

- A. Manual Backup
- **B. Schedule**
- C. Log Catchup
- D. update

Antwort: B

Begründung:

According to the Nutanix Database Automation (NCP-DB) learning documents, the Schedule feature of the Time Machine allows developers to automate the data refresh for their clones¹. This feature eliminates the time-consuming, complex process of database clone/refresh, allowing admins to create database clones/refresh to any point in time in just a few minutes¹. Please refer to the official Nutanix documentation and training materials for more detailed information².

136. Frage

Which Time Machine feature allows developers to automate the data refresh for their clones?

- A. Manual Backup
- **B. Schedule**
- C. Log Catchup
- D. update

Antwort: B

Begründung:

According to the Nutanix Database Automation (NCP-DB) learning documents, the Schedule feature of the Time Machine allows developers to automate the data refresh for their clones¹. This feature eliminates the time-consuming, complex process of database clone/refresh, allowing admins to create database clones/refresh to any point in time in just a few minutes¹. Please refer to the official Nutanix documentation and training materials for more detailed information².

137. Frage

Which action must an administrator take in Era Networks before using Era to provision a MSSQL AG cluster?

- **A. A private network must be configured in Era for the heartbeat traffic.**
- B. A network that has a DHCP pool must be configured in Era.
- C. A that has a static pool managed by Era must be configured.
- D. A network in each data center must be configured for Era.

Antwort: A

Begründung:

According to the Nutanix Database Automation (NCP-DB) learning documents, before using Era to provision a MSSQL AG cluster, an administrator must configure a private network in Era for the heartbeat traffic¹. This is because the heartbeat traffic is crucial for maintaining the health and status of the MSSQL AG cluster. The heartbeat traffic is used by the nodes in the cluster to communicate with each other and check the status of the other nodes. If a node does not receive a heartbeat from another node within a certain time frame, it assumes that the other node has failed and takes appropriate action²³⁴.

138. Frage

When using the Patch OS now feature in NDB, how would an administrator limit the updates to security updates only for Red Hat-based operating systems?

- A. Check Advanced Options and under Custom commands, enter yum update -security in the operating system patching command window.
- B. Check Advanced Options and under Pre-post commands, enter yum update security in the pre-operating system patching command window.
- C. Point the database VM to a custom patch repository and enter yum update - security command.
- D. Point the database VM to a custom patch repository before using the Patch OS now feature.

Antwort: A

Begründung:

When using the "Patch OS now" feature in NDB to apply updates to a Red Hat-based operating system, the administrator can limit updates to security patches only by leveraging the Advanced Options. Under the "Custom commands" section of the operating system patching command window, entering `yum update -- security` instructs the package manager to install only security-related updates. This ensures the system remains secure without applying all available updates, which could introduce instability.

Other options are incorrect or incomplete:

* A. Point the database VM to a custom patch repository and enter `yum update --security` command This requires manual intervention outside NDB's patching framework.

* B. Check Advanced Options and under Pre-post commands, enter `yum update security` in the pre- operating system patching command window: Pre-post commands are for pre/post actions, not the main patching process, and the syntax lacks the `--security` flag.

* C. Point the database VM to a custom patch repository before using the Patch OS now feature:

This sets up a repository but doesn't specify security-only updates within NDB's interface.

Thus, the verified answer is D, aligning with NDB's patching customization.

139. Frage

How does NDB send notifications when alerts are generated?

- A. Pulse
- B. SNMP
- C. APIs
- D. Email

Antwort: D

Begründung:

NDB sends notifications when alerts are generated via email. The email notifications can be configured to send to one or more recipients, and can be customized to include the alert severity, category, description, and resolution steps. The email notifications help to inform the database administrator and other stakeholders about the status and issues of the NDB-managed databases and operations.

NDB does not send notifications via SNMP, APIs, or Pulse. SNMP is a protocol for collecting and organizing information about managed devices on a network. APIs are interfaces for communicating and exchanging data between different applications or systems. Pulse is a feature of the Nutanix cluster that collects and sends diagnostic and usage data to Nutanix for analysis and support.
