WGU Network-and-Security-Foundation Sample Questions (Q51-Q56):

NEW QUESTION # 51

Which layer of the OSI model includes HTTP?

- A. Session
- B. Network
- C. Application
- D. Transport

Answer: C

Explanation:

The Application layer (Layer 7 of the OSI model) includes Hypertext Transfer Protocol (HTTP), which is used for web communication. This layer provides network services directly to applications and users.

- * Network layer deals with IP addressing and packet routing.
- * Session layer manages connections but does not include HTTP.
- * Transport layer ensures reliable data transmission but does not handle application protocols.

NEW QUESTION # 52

A company's internal messaging system is being redesigned. The authentication procedures were so cumbersome that employees were using personal email to communicate.

What is the security principle implemented in this scenario?

- A. Least common mechanism
- B. Zero-trust model
- C. Fail-safe
- D. Psychological acceptability

Answer: D

Explanation:

Psychological acceptability states that security measures should be user-friendly and not overly burdensome.

If security controls are too complex, users may bypass them, leading to weaker security. In this case, employees used personal email because authentication procedures were too cumbersome.

- * Zero-trust model enforces strict access control, not usability.
- * Least common mechanism limits shared resources.
- * Fail-safe ensures secure failure handling, not usability.

NEW QUESTION # 53

An organization has experienced a series of data breaches and needs to ensure that data remains protected even if intercepted. Which security measure should be implemented?

- A. Role-based access control (RBAC)
- B. Data encryption
- C. Two-factor authentication (2FA)
- D. Patch management

Answer: B

Explanation:

Data encryption protects sensitive information by encoding it into an unreadable format, ensuring that even if attackers intercept the data, they cannot decipher it without the proper decryption key. This is crucial for protecting stored and transmitted data.

* RBAC controls user access but does not secure data in transit.

* 2FA strengthens authentication but does not secure stored or transmitted data.

* Patch management fixes software vulnerabilities but does not directly protect intercepted data.

NEW QUESTION # 54

An individual has been tasked with setting up an office network. During the process, there is a need for a device that extends the range of a network.

Which device should be used?

- A. Server
- B. Switch
- C. Access point
- D. Router

Answer: C

Explanation:

An access point (AP) is a network device that extends the coverage of a wireless network by acting as a bridge between wired and wireless devices. It allows users to connect to a network without needing a direct wired connection. APs are particularly useful in large office spaces where Wi-Fi signals may not reach all areas.

* Routers primarily manage network traffic but do not directly extend network range unless they include built-in AP functionality.

* Servers are used for hosting applications and storing data but do not extend network connectivity.

* Switches connect wired devices within a local network but do not extend wireless network range.

NEW QUESTION # 55

A company is designing an information system and is maintaining a focus on the user experience and resulting productivity rather than on the technology itself.

What is the security principle implemented in this scenario?

- A. Human-centeredness
- B. Least common mechanism
- C. Zero-trust model
- D. Fail-safe

Answer: A

Explanation:

Human-centeredness in security design prioritizes user experience and productivity while implementing security measures. It ensures that security policies are intuitive and do not excessively burden users, reducing resistance to security compliance.

* Least common mechanism minimizes shared resources to enhance security.

* Fail-safe ensures secure defaults in case of system failure.

* Zero-trust model assumes no inherent trust in users or devices.
