- A. A person with in-depth technical skills
- B. A person with the ability to complete tasks
- C. A person who brings new ideas to the team

Answer: C

NEW QUESTION # 140

Your company just won a contract to create a new sales application and has committed to a very aggressive delivery timeline. Due to the quick turnaround your primary stakeholder wants to be heavily involved in the design and is very anxious to see the outcome. Because of this, your company has decided to use a spiral development approach. You have a defined test policy and typically use an analytical approach to testing, however, this approach will not work with the development approach.

What test strategy should be utilized? [3]

- A. Model-based
- B. Reactive
- C. Standard-compliant
- D. Methodical

Answer: B

Explanation:

A reactive test strategy is a test strategy that uses the actual behavior and results of the software under test to design and execute tests, without prior knowledge or documentation of the software¹. A reactive test strategy should be utilized for a project that uses a spiral development approach, which is a type of iterative

/incremental approach that adds risk analysis and prototyping activities to each iteration². A reactive test strategy is suitable for a spiral development approach because it allows for flexibility, adaptability, and creativity in the testing process, as well as for early feedback, risk reduction, and continuous improvement in the software development process³. Therefore, option D is the correct answer. Option A is incorrect because a model-based test strategy is a test strategy that uses models to represent the desired behavior and structure of the software under test, and to derive test cases, test data, test procedures, and test oracles. A model-based test strategy may not work well with a spiral development approach, as it requires the availability and stability of the models, which may not be the case in a spiral development approach that involves frequent changes and refinements of the software under test. Option B is incorrect because a methodical test strategy is a test strategy that uses predefined test methods, techniques, and procedures to design and execute tests, such as equivalence partitioning, boundary value analysis, or decision table testing. A methodical test strategy may not work well with a spiral development approach, as it requires the availability and stability of the test basis, such as the requirements, specifications, or design documents, which may not be the case in a spiral development approach that involves frequent changes and refinements of the software under test. Option C is incorrect because a standard-compliant test strategy is a test strategy that follows a predefined set of standards, guidelines, or regulations to design and execute tests, such as ISO, IEEE, or CMMI. A standard-compliant test strategy may not work well with a spiral development approach, as it requires the compliance and consistency of the testing process, which may not be the case in a spiral development approach that involves frequent changes and refinements of the software under test. NEW QUESTION # 141

Which of the following metrics would be most beneficial to collect to determine the effectiveness of a review process?

- A. The development language used to create each module that was reviewed

- B. The elapsed time between each module's review and its corresponding deployment into production
- **C. The number of defects found in production for each module that was reviewed**
- D. The business criticality of each module that was reviewed

Answer: C

Explanation:

The effectiveness of a review process can be measured by how well it detects and removes defects from the work products being reviewed¹. One of the metrics that can indicate the defect detection capability of a review process is the number of defects found in production for each module that was reviewed². This metric can show how many defects escaped the review process and were not detected until the software was deployed. A lower number of defects found in production means a higher review effectiveness. Therefore, option A is the correct answer. Option B is incorrect because the development language used to create each module that was reviewed is not relevant to the review process effectiveness. Option C is incorrect because the elapsed time between each module's review and its corresponding deployment into production is not a measure of defect detection or removal, but rather a measure of development speed or efficiency. Option D is incorrect because the business criticality of each module that was reviewed is not a measure of defect detection or removal, but rather a measure of risk or priority. NEW QUESTION # 142

Which of the following is an advantage of specifying test conditions at a detailed level? [1]

- **A. Can be used to identify test coverage gaps**
- B. Can be used to leverage use cases for acceptance testing
- C. Saves time
- D. Improves maintainability and reduces ownership costs for the testware

Answer: A

Explanation:

The correct answer is A. Can be used to identify test coverage gaps. This is because test conditions are the items or events of a component or system that will be verified by one or more test cases. Specifying test conditions at a detailed level can help to identify test coverage gaps, which are the areas or aspects of the component or system that are not covered by the test conditions or test cases. By identifying test coverage gaps, the test team can ensure that the testing is complete and consistent with the test objectives and scope.
