An administrator is troubleshooting an issue when a high-availability (HA) failover occurs.
Which conclusion can you draw from the debug output?

- A. Both cluster members are located in the same zone.
- B. The HA cluster is accessible using HTTPS on 34.68.13.24 and 34.66.4.139.
- C. The health check has successfully updated the internal custom route to forward all internal traffic to 172.16.1.3.
- D. The HA cluster is deployed using the software-defined network (SDN) connector.

Answer: C

Explanation:
The debug output shows the internal route being updated and moved to the new next hop (172.16.1.3), indicating the health check and failover process successfully redirected internal traffic to the active HA node.

NEW QUESTION # 22
An organization is deploying an active-passive high availability (HA) cluster using passthrough load balancers in Google Cloud.
What is a critical factor for ensuring successful HA formation, failover, and traffic flow?

- A. VDOM exceptions must be configured.
- B. There can be more than two cluster members.
- C. Incoming traffic must be source NATed to ensure traffic flow symmetry.
- D. Unicast FortiGate Clustering Protocol (FGCP) must be used.

Answer: C

Explanation:
Source NAT ensures that traffic is symmetric by keeping the source IP consistent, which is critical for proper failover and session synchronization in an active-passive HA cluster using passthrough load balancers.

NEW QUESTION # 23
Which Fortinet proprietary protocol do you use when deploying an active-passive high-availability (HA) cluster in Google Cloud?

- A. Unicast FGCP
- B. Multicast FGSP
- C. Anycast FGSP
- D. Broadcast FGCP

Answer: A

Explanation:
Unicast FGCP (FortiGate Clustering Protocol) is the proprietary protocol used for active-passive HA clusters in Google Cloud, enabling state synchronization and failover communication between cluster members.

NEW QUESTION # 24
An organization has decided to deploy an active-active high-availability cluster in Google Cloud.
Which three load balancing features are critical to the successful deployment of the cluster? (Choose three.)

- A. The health check used by the internal and the external passthrough network load balancer
- B. The symmetric hashing of the internal passthrough network load balancer
- C. The L3_DEFAULT protocol in the forwarding rule of the internal passthrough network load balancer
- D. The session termination of the external passthrough network load balancer
- E. The forwarding rule for the internal passthrough network load balancer as the next hot for custom routes

Answer: A,B,E

Explanation:
Health checks ensure load balancers route traffic only to healthy cluster members.
Forwarding rules act as next hops in routing, directing traffic appropriately within the HA cluster.
Symmetric hashing ensures consistent and balanced traffic distribution across cluster members, critical for active-active deployments.

NEW QUESTION # 25
For what three reasons must you deploy a set of Google Cloud passthrough network load balancers for an active-passive high-availability (HA) FortiGate cluster instead of a set of Google Cloud proxy network load balancers? (Choose three.)

- A. Passthrough network load balancers offer the highest throughput.
- B. Passthrough network load balancers rely on API calls from FortiGate devices during HA failovers.
- C. Passthrough network load balancers can forward all protocols.
- D. Passthrough network load balancers support health checks.
- E. Passthrough network load balancers terminate SSL connections.

Answer: A,C,D

Explanation:
Passthrough load balancers support health checks to monitor backend health for failover.
They can forward all protocols, not limited to HTTP/HTTPS like proxy load balancers.
Passthrough load balancers provide higher throughput because they don't terminate sessions.
