* WMI Protocol: Windows Management Instrumentation (WMI) is the appropriate protocol for this task.
SIEM Event Logs: WMI can collect security, application, and system logs from Windows devices.
PAM Events: WMI can also gather performance metrics, such as CPU usage, memory utilization, and disk activity.
* Comprehensive Data Collection: Using WMI ensures that both types of data are collected efficiently from the Windows server.

- A. Down status is assigned because of packet loss.
- B. Up status is assigned because of received packets.
- C. Critical status is assigned because of reduction in number of packets received.
- D. Degraded status is assigned because of packet loss

Answer: D

Explanation:
* Device Status in FortiSIEM: FortiSIEM assigns different statuses to devices based on their operational state and performance metrics.
* Packet Loss Impact: The reported packet loss percentage directly influences the status assigned to a device. Packet loss between 50% and 98% indicates significant network issues that affect the device's performance.
* Degraded Status: When packet loss is between 50% and 98%, FortiSIEM assigns a "Degraded" status to the device. This status indicates that the device is experiencing substantial packet loss, which impairs its performance but does not render it completely non-

functional.
* Reasoning: The "Degraded" status helps administrators identify devices with serious performance issues that need attention but are not entirely down.
