100% Pass 2025 Authoritative 156-836: Exam Check Point Certified Maestro Expert - R81 (CCME) Torrent

You may urgently need to attend 156-836 certificate exam and get the certificate to prove you are qualified for the job in some area. If you buy our 156-836 study materials you will pass the test almost without any problems. Our 156-836 study materials boost high passing rate and hit rate so that you needn't worry that you can't pass the test too much. To further understand the merits and features of our 156-836 Practice Engine you could look at the introduction of our product in detail.

CheckPoint Check Point Certified Maestro Expert - R81 (CCME) Sample Questions (Q52-Q57):

NEW QUESTION # 52

The _____ command will allow users to update the specified file on all SGMs.

- A. g_all"
- B. g_cat
- C. sed
- D. g_update_conf_file

Answer: D

Explanation:

Explanation

The g_update_conf_file command is a global command that allows users to update the specified file on all Security Group Members

of the current Security Group. The command takes the file name and the parameter-value pair as arguments and updates the file accordingly. For example, `g_update_conf_file fwkern.conf fwha_enable_arp=1` will add or modify the `fwha_enable_arp` parameter in the `fwkern.conf` file on all SGMs.

NEW QUESTION # 53

Which is a key driver for Scalable Platform?

- **A. On-demand flexibility in reconfiguration.**
- B. Cloud-level security by maximizing capabilities of existing hardware.
- C. Resiliency is achieved through the use of redundant hardware.
- D. HyperSync provides scalability by reducing overhead.

Answer: A

Explanation:

The Scalable Platform software allows you to easily add or remove security gateways from a security group without affecting the existing configuration. You can also use the command line interface or the web UI to reconfigure the security group on demand.

NEW QUESTION # 54

What is an uplink interface used for?

- A. To connect in between Orchestrators
- **B. To connect Orchestrators to customer's infrastructure**
- C. To connect appliances to customer's infrastructure
- D. To connect in between appliances

Answer: B

Explanation:

An uplink interface in a Check Point Maestro environment is specifically used to connect Maestro Hyperscale Orchestrators (MHOs) to the customer's network infrastructure, such as switches, routers, or firewalls. These interfaces facilitate the transmission and reception of management and control traffic between the MHOs and the customer's network. They are critical for integrating the Maestro system with the external network environment.

Exact Extract:

"Uplink interfaces are used to connect Maestro Hyperscale Orchestrators (MHOs) to the customer's network infrastructure, such as switches, routers, or firewalls. They are also used to send and receive management and control traffic from the customer's network to the MHOs."

-Check Point Certified Maestro Expert (CCME) R81.X Courseware, Module 1: Introduction to Check Point Maestro, Lesson 1.3: Maestro Interfaces, page 1-10

-Check Point R81 Maestro Administration Guide, Chapter 1: Introduction to Check Point Maestro, Section: Interfaces, page 1-8

Explanation of Options:

* A. To connect in between appliances: Incorrect, as uplink interfaces are not used to connect appliances (Security Group Members) to each other. This is typically handled by downlink interfaces or internal backplane connections.

* B. To connect appliances to customer's infrastructure: Incorrect, as appliances (SGMs) connect to the Orchestrators via downlink interfaces, not directly to the customer's infrastructure.

* C. To connect Orchestrators to customer's infrastructure: Correct, as uplink interfaces are explicitly designed for this purpose, as stated in the courseware and administration guide.

* D. To connect in between Orchestrators: Incorrect, as connections between Orchestrators (e.g., in a Dual-Site setup) are typically handled via site-sync ports, not uplink interfaces.

NEW QUESTION # 55

Which command can be used during an upgrade to verify that the upgraded SGMs have returned to UP status before upgrading other SGMs?

- A. asg monitor
- B. asg perf -v
- C. cpview
- D. asg stat -v

Answer: D

Explanation:

The asg stat -v command is used to verify the status of Security Group Members (SGMs) during an upgrade in a Maestro environment. This command provides detailed status information, including whether SGMs are in the UP state, which is critical before proceeding with upgrades to other SGMs to ensure system stability and continuity.

Exact Extract:

"The command 'asg stat -v' can be used during an upgrade to verify that the upgraded Security Group Members (SGMs) have returned to UP status before upgrading other SGMs. This command provides a detailed view of the status of all SGMs in the Security Group, ensuring that the upgraded members are operational."

-Check Point Certified Maestro Expert (CCME) R81.X Courseware, Module 4: Using the Command Line Interface and WebUI, Lesson 4.4: System Diagnostics, page 4-16

-Check Point R81 Maestro Administration Guide, Chapter 4: Using the Command Line Interface and WebUI, Section: System Diagnostics, page 4-13 Explanation of Options:

* A. asg monitor: Incorrect, as asg monitor is used for real-time monitoring but does not provide detailed status verification for SGMs during upgrades.

* B. cpview: Incorrect, as cpview provides performance and system statistics but is not specific to verifying SGM status post-upgrade.

* C. asg perf -v: Incorrect, as asg perf -v focuses on performance metrics, not SGM status verification.

* D. asg stat -v: Correct, as this command is explicitly used to check the UP status of SGMs during upgrades, as per the documentation.

NEW QUESTION # 56

What type of cluster can a Security Group can be compared to?

- A. Active / Backup
- B. VSLS
- C. Load Sharing Active / Active
- D. Active / Standby

Answer: C

Explanation:

Explanation

A Security Group can be compared to a Load Sharing Active / Active cluster because it consists of multiple Security Group Members that share the traffic load and provide high availability and scalability. Each Security Group Member is an active firewall that processes traffic according to the Security Group policy and synchronizes its state with other members. The Maestro Orchestrator acts as a load balancer that distributes the traffic among the Security Group Members based on their capacity and availability.
