## CompTIA Server+ Certification Exam Sample Questions (Q209-Q214):

### NEW QUESTION # 209

A server administrator is completing an OS installation for a new server. The administrator patches the server with the latest vendor-suggested software, configures DHCP, and verifies all network cables are properly connected in the IDF, but there is no network connectivity. Which of the following is the MOST likely reason for the lack of connectivity?

- A. The HIDS is preventing the connection.
- B. The OS version is not compatible with the network switch vendor.
- C. The DNS configuration is invalid.
- D. The VLAN is improperly configured.

**Answer: D**

Explanation:

Explanation

If the server administrator patches the server with the latest vendor-suggested software, configures DHCP, and verifies all network cables are properly connected in the IDF, but there is no network connectivity, then the most likely reason for the lack of connectivity is that the VLAN is improperly configured. A VLAN (Virtual Local Area Network) is a logical grouping of network devices that share the same broadcast domain and can communicate with each other without routing. If the server is assigned to a different VLAN than the DHCP server or the default gateway, it will not be able to obtain an IP address or reach other network devices. The DNS configuration is not relevant for network connectivity, as DNS only resolves names to IP addresses. The OS version is not likely to be incompatible with the network switch vendor, as most network switches use standard protocols and interfaces. The HIDS (Host-based Intrusion Detection System) is not likely to prevent the connection, as HIDS only monitors and alerts on suspicious activities on the host. References:

### NEW QUESTION # 210

A technician is sizing a new server and, for service reasons, needs as many hot-swappable components as possible. Which of the following server components can most commonly be replaced without downtime?

(Select three).

- A. CMOSIC
- B. Power supplies
- C. BIOS
- D. Motherboard
- E. Drives
- F. Memory
- G. Fans
- H. Processor

**Answer: B,E,G**

Explanation:

Explanation

Drives, fans, and power supplies are server components that can most commonly be replaced without downtime if they are hot-swappable. Hot-swappable components can be removed and inserted while the server is running, without affecting its operation or performance. Drives store data and applications, fans cool down the server components, and power supplies provide electricity to the server. Replacing these components can prevent data loss, overheating, or power failure. ### NEW QUESTION # 211

A DHCP server is configured to issue IP addresses. Client machines have successfully obtained an IP address. However, when testing, users are unable to browse the Internet. Which of the following might be the MOST likely cause?

- A. The DHCP server ran out of IP addresses.
- B. The client machines are not members of the domain.
- C. The DHCP server is unable to communicate with the DNS server.
- D. DNS configuration on the DHCP server is missing.

**Answer: D**

## NEW QUESTION # 212

An administrator is setting up a new employee's read/write access to a document on the file server. Currently, the user can open the file, but edits cannot be saved. Which of the following should the administrator do so the user can save the updated file while maintaining least-privilege access?

- A. Give the user "full control" rights to the folder.
- B. Give the user "read and execute" rights to the file.
- C. Give the user "modify" rights to the file.
- D. Give the user "list folder contents" rights to the folder.

**Answer: C**

Explanation:

To enable a user to both read and write to a file, the administrator needs to provide "modify" rights. This permission level allows the user not only to open and view the file (read) but also to make changes and save those changes back to the file (write). "Read and execute" rights would allow the user to open and run the file but not make any changes. "List folder contents" rights would enable the user to view the files within a folder but not make changes to them. "Full control" rights would provide the user with complete control over the file, including the ability to change permissions and delete the file, which exceeds the principle of least-privilege access necessary for this task.

## NEW QUESTION # 213

Joe, a user in the IT department cannot save changes to a sensitive file on a Linux server. An ls -l & shows the following listing:

Which of the following commands would BEST enable the server technician to allow Joe to have access without granting excessive access to others?

- A. chmod 777 filename
- B. chown Joe filename
- C. Chmod g+w filename
- D. chgrp IT filename

**Answer: C**

Explanation:

Explanation

The chmod command is used to change the permissions of files and directories. The g+w option means to grant write permission to the group owner of the file. Since Joe is a member of the IT group, which is also the group owner of the file, this command will allow him to save changes to the file without affecting the permissions of other users.
