NEW QUESTION #24

If a GPU is not detected in the IPMI GUI reports, what would be the next step to recover the missing GPU?

- A. Turn off the server and reseat the motherboard tray.
- B. Press the GPU button on the rear of the server for 5 seconds to reinitialize the GPU tray.
- C. While powered on, remove the GPU tray, and remove all power connectors and fan connectors from the baseboard and then reseat the connectors.
- D. Turn off the server, then try reseating the GPU and heatsink, turn on the server, and verify in IPMI GUI that the GPU has returned.

Answer: D

Explanation:

When a GPU is not detected in the IPMI GUI reports, the recommended recovery method is topower off the system, reseat the GPU and heatsink, then power it back on and check the IPMI GUI for detection. This process ensures that the GPU is properly connected and making full contact with the system board.

- * Option A (pressing a GPU button for 5 seconds) is incorrect because there is no dedicated reinitialization button for GPU detection in Supermicro MI300X systems.
- * Option B (removing the GPU tray while powered on) is not advisable as it could cause damage to components.
- * Option D (reseating the motherboard tray) is unnecessary, as the issue is likely limited to GPU connectivity rather than a full system board issue.
- * Option C (powering off the system, reseating the GPU, and verifying in IPMI GUI)follows proper troubleshooting guidelines as documented in Supermicro'stroubleshooting and system health monitoring sections.
