## UiPath Automation Developer Associate v1 Exam Sample Questions (Q113-Q118):

### NEW QUESTION # 113

A developer is working on an automation using the REFramework. Each transaction item represents a piece of client information. For each customer, the automated procedure must click the "Generate Shipment Details" button. This generates a table of shipment records for each customer. What type of exception occurs when the data is not accessible, the created table displays only the header row, and processing for that client must be halted?

- A. **BusinessRuleException**
- B. ApplicationException
- C. NullReferenceException
- D. SystemException

**Answer: A**

Explanation:

Explanation

A BusinessRuleException occurs when a business rule is violated or a business requirement is not met during the execution of a process. In this case, the data is not accessible and the created table displays only the header row, which means that the expected output for the client is not generated. Therefore, processing for that client must be halted and a BusinessRuleException must be thrown. (UiPath Studio - Exception Handling - UiPath Academy) References:

### NEW QUESTION # 114

A developer is building a process which reads invoice data from the "Invoices.csv" file that includes a Total column of type Double. Instructions: Using the drop-down lists shown in the following exhibit, configure the Filter Data Table Wizard to keep all invoices with a Total value that is over 10 000 USD.

**Answer:**

Explanation:

Explanation:

To configure the Filter Data Table Wizard to keep all invoices with a Total value that is over 10 000 USD, you should choose the following options from the drop-down lists:

Column: Total Operation: > Value: 10000

The reason for choosing these options is to filter the data table based on the condition that the Total column value is greater than 10000. This will keep only the rows that satisfy this condition and remove the rest. You can learn more about the Filter Data Table activity and how to use it from the following sources:

#### NEW QUESTION # 115

Based on the image provided, which catch block will be executed if the Employees Excel file is open during runtime?

- A. None
- B. Exception
- C. IOException
- D. BusinessRuleException

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation:

When a UiPath bot tries to read an Excel file that is open in another application, it encounters an IOException (Input/Output Exception).

## Step-by-Step Execution Guide: Handling IOException in UiPath

1## Try to Read an Open Excel File

vb

CopyEdit

Read Range Workbook: "Employees.xlsx"

2## If the file is already open, IOException occurs

3## The "IOException" Catch Block Handles the Error

Real-World Use Case: Ensuring File Availability Before Reading

# Scenario:

A bot is scheduled to read employee records every morning at 8 AM.

# If an employee accidentally leaves the Excel file open, the bot will fail.

# To prevent failure, the bot:

\* Tries to read the file.

\* If IOException occurs, sends an email alert instead of failing.

vb

CopyEdit

Try

Read Range Workbook: "Employees.xlsx"

Catch ex As IOException

Send Email: "Please close the Employees file!"

# This makes the automation resilient!

Why the other options are incorrect?

# A. None - An exception will occur if the file is open.

# C. BusinessException - This is for custom business logic errors, not file access issues.

# D. Exception - The IOException block specifically catches this error before reaching the generic Exception block.

## NEW QUESTION # 116

A developer has created a variable of type List of Strings named "UsersList", and initialized it with an empty list: "UsersList = new List(Of String)".

What is printed in the log message after the following Invoke Code is executed?

The screenshot displays the UiPath Studio interface. At the top, the 'Invoke code arguments' window is open, showing a table with the following data:

Name	Direction	Type	Value
Users_List	In	List<String>	Users_List

Below the table is a 'Create Argument' section. The 'Invoke Code' activity is shown with the following code:

```
Users_List.Add("User1")
Users_List.Add("User2")
```

Below the code are 'Edit Code' and 'Edit Arguments' buttons. The 'Log Message' activity is shown below the 'Invoke Code' activity, with the following settings:

- Log Level: Info
- Message: Users List.Count

The 'Log Message' activity is connected to the 'Invoke Code' activity via an arrow. The 'Log Message' activity is also shown in the 'Log Message' window at the bottom of the screen, displaying the message 'Users List.Count'.

- A. 0
- **B. 1**
- C. Object reference not set to an instance exception is thrown
- D. System Argument Exception is thrown

**Answer: B**

Explanation:

The code is adding two items to the list, but since the list is initialized as an empty list, the count will be 0.

#### NEW QUESTION # 117

How would you define a linear process in UiPath?

- A. The steps of the process are performed multiple times, but each time different data items are used.
- B. The steps of the process refer to the execution of steps in a sequential manner, where each subsequent step depends on the successful completion of the previous step.
- C. The steps of the process repeat multiple times over different data items. However, the automation design is such that each repeatable part processes independently.
- **D. The process steps are performed only once. If the need is to process additional data, then the automation must execute again.**

**Answer: D**

Explanation:

A linear process in UiPath is a type of automation process that consists of a series of steps that are executed only once for a single data item or transaction. A linear process does not have any loops or iterations, and it does not depend on any external factors or conditions. A linear process is suitable for scenarios where the automation process is simple, straightforward, and does not require any dynamic branching or decision making.
