Network Appliance Implementation Engineer - Data Protection Exam Sample Questions (Q136-Q141):

NEW QUESTION # 136

You have enabled the SnapMirror global throttling feature to restrict bandwidth that is used by SnapMirror operations over the network for both incoming and outgoing transfers in ONTAP.

In this scenario, which two statements are correct? (Choose two.)

- A. Global throttling is enforced at a cluster level and does not work with the per-relationship throttle feature for SnapMirror.
- B. Global throttling is enforced at a node level and works with the per-relationship throttle feature for SnapMirror.
- C. Global throttling is not enforced until the combined bandwidth of per-relationship transfers exceeds the value of global throttle.
- D. Global throttling is enforced at a cluster level and works with the per-relationship throttle feature for SnapMirror.

Answer: C,D

NEW QUESTION # 137

Your IT company is using NetApp FlexClone on a two node AFF cluster with 20TB of data to rapidly provision environments for each developer.

Each environment is replicated to an eight node AFF C-Series cluster at a DR site using SnapMirror. You notice that the environments are consuming significantly more disk space on the destination cluster than on the source cluster.

In this scenario, which action will minimize the disk usage on the destination cluster?

- A. Enable Flexclone copies on the DR side.
- B. Consolidate the SnapMirror destination volumes onto a single aggregate.
- C. Enable SnapMirror network compression.
- D. Distribute the SnapMirror destination volumes evenly across the available aggregates.

Answer: A

Explanation:

FlexClone volumes are space-efficient on the source cluster because they share blocks with the parent. However, SnapMirror transfers them as full physical copies by default unless you re-create them as FlexClone volumes on the DR site.

Enabling FlexClone copies on the destination will preserve their space efficiency and minimize disk usage on the DR cluster.

NEW QUESTION # 138

You are asked to verify that data stored in your disaster recovery site can be restored and is viable. Currently, you have a NetApp SnapMirror relationship with a MirrorAllSnaps policy type that is enabled and is updating frequently.

What would be a nondisruptive method to carry out a detailed validation of your disaster-recovery strategy?

- A. Break the SnapMirror relationship and validate the data.
- B. Perform a SnapMirror reverse resynchronization to restore the data from the destination cluster to the source cluster, and validate the data.
- C. Create a FlexClone volume of the destination volume on the destination cluster, and validate the data.
- D. Use SyncMirror on the destination aggregate on the destination cluster, and validate the data.

Answer: B

NEW QUESTION # 139

What is the purpose of a Snapshot in NetApp ONTAP?

- A. To provide a way to delete unwanted data
- B. To provide an easy and fast way to restore data
- C. To provide a way to encrypt data
- D. To provide a way to compress data

Answer: B

NEW QUESTION # 140

You have recently installed and set up a new NetApp HCI deployment in your data center that consists of four compute nodes and four storage nodes. Inside this HCI deployment, you are using ONTAP Select for file services. You must protect the data inside the ONTAP Select VM in case of a rack failure.

Which two methods would accomplish this task? (Choose two.)

- A. Enable FabricPools in the ONTAP Select instance.
- B. Replicate the volumes using SnapMirror from inside the ONTAP Select VM to an existing ONTAP cluster.
- C. Using SolidFire real-time remote replication, replicate the hosting volumes to an ONTAP cluster.
- D. Replicate the SVMs from inside the ONTAP Select VM to an existing ONTAP cluster using SVM D

Answer: C,D
