ISC CISSP Certification is a globally recognized certification for individuals who want to demonstrate their expertise in the field of information security. The CISSP certification is offered by the International Information System Security Certification Consortium (ISC) and is considered to be one of the most prestigious certifications in the field of cybersecurity. Certified Information Systems Security Professional (CISSP) certification is designed for professionals who are responsible for designing, implementing, and managing information security programs in their organizations.

What to Explore: (ISC)2 CISSP Exam Topics

The CISSP exam evaluates the applicants' knowledge and expertise in a wide range of areas. The skills measured in this certification test are typically combined in 8 objectives that are listed below:

- **Identity and Access Management (13%)**

Within this domain, the information security professionals demonstrate that they know how to control the process of user access to data. This topic generally covers authorization mechanisms and logical and physical access to assets. It also involves the skills associated with the access and identity provisioning lifecycle, identification and authentication, and Identity-as-a-Service integration.

- **Software Development Security (10%)**

Before answering the questions from this topic, the professionals need to understand software security and know how to apply and enforce it. In this last area, the individuals need to demonstrate that they have the ability to secure coding standards and guidelines and provide security controls in development environments. They also need to show that they can ensure the effectiveness of software security and ensure security in the lifecycle of software development.

- **Security and Risk Management (15%)**

This is the first and largest domain in the (ISC)2 CISSP exam content, covering a comprehensive overview of everything one should know about information systems management. By answering the questions from this section, the students need to prove their knowledge of the confidentiality, availability, and integrity of information. They should also prove that they have a deep understanding of security governance principles, regulatory and legal issues related to information security, compliance requirements, risk-based management concepts, and IT policies and procedures.

- **Communications and Network Security (14%)**

This objective encompasses the protection and design of the organization's networks. This means that answering the questions in this area requires that the learners have knowledge of the processes that include securing communication channels, securing network components, and securing design principles for network infrastructure.

- **Asset Security (10%)**

Answering the questions from the second topic area, the test takers need to be well versed with all the physical requirements of information security. This means that they need to show that they have knowledge of ownership and classification of information and assets, as well as data security controls. In addition, they should be able to explain privacy, handling requirements, and retention periods.

- **Security Operations (13%)**

This section focuses on how plans are properly implemented. It specifically involves skills in incident management, business continuity, disaster recovery, and management of physical security. The candidates also need to demonstrate that they understand and can support investigations, as well as accomplish logging and monitoring activities. Besides that, they are required to prove that they have the ability to apply resource protection techniques and secure the provision of resources. The examinees also need to have a thorough understanding of the basic concepts of security operations and the requirements for investigation types.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q165-Q170):

NEW QUESTION # 165

When backing up an applications system's data, which of the following is a key question to be answered first?

- A. How to store backups
- **B. What records to backup**
- C. When to make backups
- D. Where to keep backups

Answer: B

Explanation:

It is critical that a determination be made of WHAT data is important and should be retained and protected. Without determining the data to be backed up, the potential for error increases. A record or file could be vital and yet not included in a backup routine. Alternatively, temporary or insignificant files could be included in a backup routine unnecessarily.

The following answers were incorrect:

When to make backups Although it is important to consider schedules for backups, this is done after the decisions are made of what should be included in the backup routine.

Where to keep backups The location of storing backup copies of data (Such as tapes, on-line backups, etc) should be made after determining what should be included in the backup routine and the method to store the backup.

How to store backups The backup methodology should be considered after determining what data should be included in the backup routine.

NEW QUESTION # 166

Internet Protocol (IP) source address spoofing is used to defeat

- A. Reverse Address Resolution Protocol (RARP).
- B. Transmission Control Protocol (TCP) hijacking.
- C. Address Resolution Protocol (ARP).
- D. address-based authentication.

Answer: D

Explanation:

Internet Protocol (IP) source address spoofing is used to defeat address-based authentication, which is a method of verifying the identity of a user or a system based on their IP address. IP source address spoofing involves forging the IP header of a packet to make it appear as if it came from a trusted or authorized source, and bypassing the authentication check. IP source address spoofing can be used for various malicious purposes, such as denial-of-service attacks, man-in-the-middle attacks, or session hijacking³⁴.

NEW QUESTION # 167

Which of the following is an advantage of prototyping?

- A. Prototype systems can provide significant time and cost savings.
- B. It ensures that functions or extras are not added to the intended system.
- C. Change control is often less complicated with prototype systems.
- D. Strong internal controls are easier to implement.

Answer: A

Explanation:

Prototype systems can provide significant time and cost savings, however they also have several disadvantages. They often have poor internal controls, change control becomes much more complicated and it often leads to functions or extras being added to the system that were not originally intended.

NEW QUESTION # 168

The goal of a Business Impact Analysis (BIA) is to determine which of the following?

- A. Cost effectiveness of business recovery
- B. Cost effectiveness of installing software security patches
- C. Resource priorities for recovery and Maximum Tolerable Downtime (MTD)
- D. Which security measures should be implemented

Answer: C

Explanation:

According to the CISSP For Dummies³, the goal of a Business Impact Analysis (BIA) is to determine the resource priorities for recovery and Maximum Tolerable Downtime (MTD) for each business process and function. This means that the BIA should identify the criticality and dependencies of each business process and function, and the maximum amount of time that they can be disrupted without causing unacceptable consequences to the organization. The BIA should also determine the recovery point objectives (RPOs) and recovery time objectives (RTOs) for each business process and function, which are the acceptable levels of data loss and downtime respectively. The BIA should not focus on the cost effectiveness of business recovery or installing software security patches, as these are not the primary objectives of the BIA. The BIA should also not determine which security measures should be implemented, as this is the role of the risk assessment and risk management processes. References: 3

NEW QUESTION # 169

Copyright provides protection for which of the following?

- A. Discoveries of natural phenomena
- B. New and non-obvious inventions
- **C. A particular expression of an idea**
- D. Ideas expressed in literary works

Answer: C

Explanation:

Copyright is a form of intellectual property that grants the author or creator of an original work the exclusive right to reproduce, distribute, perform, display, or license the work. Copyright does not protect ideas, concepts, facts, discoveries, or methods, but only the particular expression of an idea in a tangible medium, such as a book, a song, a painting, or a software program^{1,2}.
