NEW QUESTION # 229

Which log type will help the engineer verify whether packet buffer protection was activated?

- A. Configuration
- B. Data Filtering

- C. Threat
- D. Traffic

Answer: C

Explanation:

Explanation

The log type that will help the engineer verify whether packet buffer protection was activated is Threat Logs.

Threat Logs are logs generated by the Palo Alto Networks firewall when it detects a malicious activity on the network. These logs contain information about the source, destination, and type of threat detected. They also contain information about the packet buffer protection that was activated in response to the detected threat.

This information can help the engineer verify that packet buffer protection was activated and determine which actions were taken in response to the detected threat.

Packet buffer protection is a feature that prevents packet buffer exhaustion by dropping packets, discarding sessions, or blocking source IP addresses when the packet buffer utilization exceeds a certain threshold. The firewall records these events in the threat log with different threat IDs and names¹. The system log also records an alert event when the packet buffer congestion reaches the alert threshold². The other types of logs do not show packet buffer protection events. References: 1:

NEW QUESTION # 230

View the GlobalProtect configuration screen capture.

What is the purpose of this configuration?

- A. It configures the tunnel address of all internal clients to an IP address range starting at 192.168.10.1.
- B. It forces the firewall to perform a dynamic DNS update, which adds the internal gateway's hostname and IP address to the DNS server.
- C. It enables a client to perform a reverse DNS lookup on 192.168.10.1 to detect that it is an internal client.
- D. It forces an internal client to connect to an internal gateway at IP address 192.168.10.1.

Answer: C
