Most of the experts in our company have been studying in the professional field for many years and have accumulated much experience in our XDR-Engineer practice questions. Our company is considerably cautious in the selection of talent and always hires employees with store of specialized knowledge and skills. All the members of our experts and working staff maintain a high sense of responsibility, which is why there are so many people choose our XDR-Engineer Exam Materials and to be our long-term partner.

### Palo Alto Networks XDR-Engineer Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Cortex XDR Agent Configuration: This section of the exam measures skills of the XDR engineer and covers configuring endpoint prevention profiles and policies, setting up endpoint extension profiles, and managing endpoint groups. The focus is on ensuring endpoints are properly protected and policies are consistently applied across the organization.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>• Planning and Installation: This section of the exam measures skills of the security engineer and covers the deployment process, objectives, and required resources such as hardware, software, data sources, and integrations for Cortex XDR. It also includes understanding and explaining the deployment and functionality of components like the XDR agent, Broker VM, XDR Collector, and Cloud Identity Engine. Additionally, it assesses the ability to configure user roles, permissions, and access controls, as well as knowledge of data retention and compute unit considerations.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>• Detection and Reporting: This section of the exam measures skills of the detection engineer and covers creating detection rules to meet security requirements, including correlation, custom prevention rules, and the use of behavioral indicators of compromise (BIOCs) and indicators of compromise (IOCs). It also assesses configuring exceptions and exclusions, as well as building custom dashboards and reporting templates for effective threat detection and reporting.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>• Maintenance and Troubleshooting: This section of the exam measures skills of the XDR engineer and covers managing software component updates for Cortex XDR, such as content, agents, Collectors, and Broker VM. It also includes troubleshooting data management issues like data ingestion and parsing, as well as resolving issues with Cortex XDR components to ensure ongoing system reliability and performance.</li></ul>
Topic 5	<ul style="list-style-type: none"><li>• Ingestion and Automation: This section of the exam measures skills of the security engineer and covers onboarding various data sources including NGFW, network, cloud, and identity systems. It also includes managing simple automation rules, configuring Broker VM applets and clusters, setting up XDR Collectors, and creating parsing rules for data normalization and automation within the Cortex XDR environment.</li></ul>

### Palo Alto Networks XDR Engineer Sample Questions (Q40-Q45):

#### NEW QUESTION # 40

A new parsing rule is created, and during testing and verification, all the logs for which field data is to be parsed out are missing. All the other logs from this data source appear as expected. What may be the cause of this behavior?

- A. The parsing rule corrupted the database
- B. The XDR Collector is dropping the logs
- C. The Broker VM is offline
- **D. The filter stage is dropping the logs**

**Answer: D**

Explanation:

In Cortex XDR, parsing rules are used to extract and normalize fields from raw log data during ingestion, ensuring that the data is structured for analysis and correlation. The parsing process includes stages such as filtering, parsing, and mapping. If logs for which field data is to be parsed out are missing, while other logs from the same data source are ingested as expected, the issue likely lies within the parsing rule itself, specifically in the filtering stage that determines which logs are processed.

\* Correct Answer Analysis (C): The filter stage is dropping the logs is the most likely cause. Parsing rules often include a filter stage that determines which logs are processed based on specific conditions (e.

g., log content, source, or type). If the filter stage of the new parsing rule is misconfigured (e.g., using an incorrect condition like `log_type != expected_type` or a regex that doesn't match the logs), it may drop the logs intended for parsing, causing them to be excluded from the ingestion pipeline. Since other logs from the same data source are ingested correctly, the issue is specific to the parsing rule's filter, not a broader ingestion problem.

\* Why not the other options?

\* A. The Broker VM is offline: If the Broker VM were offline, it would affect all log ingestion from the data source, not just the specific logs targeted by the parsing rule. The question states that other logs from the same data source are ingested as expected, so the Broker VM is likely operational.

\* B. The parsing rule corrupted the database: Parsing rules operate on incoming logs during ingestion and do not directly interact with or corrupt the Cortex XDR database. This is an unlikely cause, and database corruption would likely cause broader issues, not just missing specific logs.

\* D. The XDR Collector is dropping the logs: The XDR Collector forwards logs to Cortex XDR, and if it were dropping logs, it would likely affect all logs from the data source, not just those targeted by the parsing rule. Since other logs are ingested correctly, the issue is downstream in the parsing rule, not at the collector level.

Exact Extract or Reference:

The Cortex XDR Documentation Portal explains parsing rule behavior: "The filter stage in a parsing rule determines which logs are processed; misconfigured filters can drop logs, causing them to be excluded from ingestion" (paraphrased from the Data Ingestion section). The EDU-260: Cortex XDR Prevention and Deployment course covers parsing rule troubleshooting, stating that "if specific logs are missing during parsing, check the filter stage for conditions that may be dropping the logs" (paraphrased from course materials). The Palo Alto Networks Certified XDR Engineer datasheet includes "data ingestion and integration" as a key exam topic, encompassing parsing rule configuration and troubleshooting.

### NEW QUESTION # 41

What happens when the XDR Collector is uninstalled from an endpoint by using the Cortex XDR console?

- A. The files are removed immediately, and the machine is deleted from the system without any retention period
- **B. It is uninstalled during the next heartbeat communication, machine status changes to Uninstalled, and the configuration data is retained for 90 days**
- C. The associated configuration data is removed from the Action Center immediately after uninstallation
- D. The machine status remains active until manually removed, and the configuration data is retained for up to seven days

**Answer: B**

Explanation:

The XDR Collector is a lightweight agent in Cortex XDR used to collect logs and events from endpoints or servers. When uninstalled via the Cortex XDR console, the uninstallation process is initiated remotely, but the actual removal occurs during the endpoint's next communication with the Cortex XDR tenant, known as the heartbeat. The heartbeat interval is typically every few minutes, ensuring timely uninstallation. After uninstallation, the machine's status in the console updates, and associated configuration data is retained for a specific period to support potential reinstallation or auditing.

\* Correct Answer Analysis (C): When the XDR Collector is uninstalled using the Cortex XDR console, it is uninstalled during the next heartbeat communication, the machine status changes to Uninstalled, and the configuration data is retained for 90 days. This retention period allows administrators to review historical data or reinstall the collector if needed, after which the data is permanently deleted.

\* Why not the other options?

\* A. The files are removed immediately, and the machine is deleted from the system without any retention period: Uninstallation is not immediate; it occurs at the next heartbeat.

Additionally, Cortex XDR retains configuration data for a period, not deleting it immediately.

\* B. The machine status remains active until manually removed, and the configuration data is retained for up to seven days: The machine status updates to Uninstalled automatically, not requiring manual removal, and the retention period is 90 days, not seven days.

\* D. The associated configuration data is removed from the Action Center immediately after uninstallation: Configuration data is retained for 90 days, not removed immediately, and the Action Center is not the primary location for this data.

Exact Extract or Reference:

The Cortex XDR Documentation Portal explains XDR Collector uninstallation: "When uninstalled via the console, the XDR Collector is removed at the next heartbeat, the machine status changes to Uninstalled, and configuration data is retained for 90 days" (paraphrased from the XDR Collector Management section). The EDU-260: Cortex XDR Prevention and Deployment course covers collector management, stating that

"uninstallation occurs at the next heartbeat, with a 90-day retention period for configuration data" (paraphrased from course materials). The Palo Alto Networks Certified XDR Engineer datasheet includes

"post-deployment management and configuration" as a key exam topic, encompassing XDR Collector uninstallation.

### NEW QUESTION # 42

In addition to using valid authentication credentials, what is required to enable the setup of the Database Collector applet on the Broker VM to ingest database activity?

- **A. Valid SQL query targeting the desired data**
- B. Access to the database audit log
- C. Access to the database transaction log
- D. Database schema exported in the correct format

**Answer: A**

Explanation:

The Database Collector applet on the Broker VM in Cortex XDR is used to ingest database activity logs by querying the database directly. To set up the applet, valid authentication credentials (e.g., username and password) are required to connect to the database. Additionally, a valid SQL query must be provided to specify the data to be collected, such as specific tables, columns, or events (e.g., login activity or data modifications).

\* Correct Answer Analysis (A): A valid SQL query targeting the desired data is required to configure the Database Collector applet. The query defines which database records or events are retrieved and sent to Cortex XDR for analysis. This ensures the applet collects only the relevant data, optimizing ingestion and analysis.

\* Why not the other options?

\* B. Access to the database audit log: While audit logs may contain relevant activity, the Database Collector applet queries the database directly using SQL, not by accessing audit logs.

Audit logs are typically ingested via other methods, such as Filebeat or syslog.

\* C. Database schema exported in the correct format: The Database Collector does not require an exported schema. The SQL query defines the data structure implicitly, and Cortex XDR maps the queried data to its schema during ingestion.

\* D. Access to the database transaction log: Transaction logs are used for database recovery or replication, not for direct data collection by the Database Collector applet, which relies on SQL queries.

Exact Extract or Reference:

The Cortex XDR Documentation Portal describes the Database Collector applet: "To configure the Database Collector, provide valid authentication credentials and a valid SQL query to retrieve the desired database activity" (paraphrased from the Broker VM Applets section). The EDU-260: Cortex XDR Prevention and Deployment course covers data ingestion, stating that "the Database Collector applet requires a SQL query to specify the data to ingest from the database" (paraphrased from course materials). The Palo Alto Networks Certified XDR Engineer datasheet includes "data ingestion and integration" as a key exam topic, encompassing Database Collector configuration.

### NEW QUESTION # 43

An engineer is building a dashboard to visualize the number of alerts from various sources. One of the widgets from the dashboard is shown in the image below:

The engineer wants to configure a drilldown on this widget to allow dashboard users to select any of the alert names and view those alerts with additional relevant details. The engineer has configured the following XQL query to meet the requirement:

dataset = alerts

| fields alert\_name, description, alert\_source, severity, original\_tags, alert\_id, incident\_id

| filter alert\_name =

| sort desc \_time

How will the engineer complete the third line of the query (filter alert\_name =) to allow dynamic filtering on a selected alert name?

- A. \$x\_axis.name
- B. \$y\_axis.name
- C. \$x\_axis.value
- D. \$y\_axis.value

**Answer: C**

Explanation:

In Cortex XDR, dashboards and widgets support drilldown functionality, allowing users to click on a widget element (e.g., an alert

name in a bar chart) to view detailed data filtered by the selected value. This is achieved using XQL (XDR Query Language) queries with dynamic variables that reference the clicked element's value. In the provided XQL query, the engineer wants to filter alerts based on the alert\_name selected in the widget.

The widget likely displays alert names along the x-axis (e.g., in a bar chart where each bar represents an alert name and its count). When a user clicks on an alert name, the drilldown query should filter the dataset to show only alerts matching that selected alert\_name. In XQL, dynamic filtering for drilldowns uses variables like \$x\_axis.value to capture the value of the clicked element on the x-axis.

\* Correct Answer Analysis (B): The variable \$x\_axis.value is used to reference the value of the x-axis element (in this case, the alert\_name) selected by the user. Completing the query with filter alert\_name = \$x\_axis.value ensures that the drilldown filters the alerts dataset to show only those records where the alert\_name matches the clicked value.

\* Why not the other options?

\* A. \$y\_axis.value: This variable refers to the value on the y-axis, which typically represents a numerical value (e.g., the count of alerts) in a chart, not the categorical alert\_name.

\* C. \$x\_axis.name: This is not a valid XQL variable for drilldowns. XQL uses \$x\_axis.value to capture the selected value, not \$x\_axis.name.

\* D. \$y\_axis.name: This is also not a valid XQL variable, and the y-axis is not relevant for filtering by alert\_name.

Exact Extract or Reference:

The Cortex XDR Documentation Portal in the XQL Reference Guide explains drilldown configuration: "To filter data based on a clicked widget element, use \$x\_axis.value to reference the value of the x-axis category selected by the user" (paraphrased from the Dashboards and Widgets section). The EDU-262: Cortex XDR Investigation and Response course covers dashboard creation and XQL, noting that "drilldown queries use variables like \$x\_axis.value to dynamically filter based on user selections" (paraphrased from course materials). The Palo Alto Networks Certified XDR Engineer datasheet lists "dashboards and reporting" as a key exam topic, including configuring interactive widgets.

## NEW QUESTION # 44

When onboarding a Palo Alto Networks NGFW to Cortex XDR, what must be done to confirm that logs are being ingested successfully after a device is selected and verified?

- A. Retrieve device certificate from NGFW dashboard
- B. Confirm that the selected device has a valid certificate
- C. Wait for an incident that involves the NGFW to populate
- **D. Conduct an XQL query for NGFW log data**

**Answer: D**

Explanation:

When onboarding a Palo Alto Networks Next-Generation Firewall (NGFW) to Cortex XDR, the process involves selecting and verifying the device to ensure it can send logs to Cortex XDR. After this step, confirming successful log ingestion is critical to validate the integration. The most direct and reliable method to confirm ingestion is to query the ingested logs using XQL (XDR Query Language), which allows the engineer to search for NGFW log data in Cortex XDR.

\* Correct Answer Analysis (A): Conduct an XQL query for NGFW log data is the correct action.

After onboarding, the engineer can run an XQL query such as `dataset = panw_ngfw_logs | limit 10` to check if NGFW logs are present in Cortex XDR. This confirms that logs are being successfully ingested and stored in the appropriate dataset, ensuring the integration is working as expected.

\* Why not the other options?

\* B. Wait for an incident that involves the NGFW to populate: Waiting for an incident is not a reliable or proactive method to confirm log ingestion. Incidents depend on detection rules and may not occur immediately, even if logs are being ingested.

\* C. Confirm that the selected device has a valid certificate: While a valid certificate is necessary during the onboarding process (e.g., for secure communication), this step is part of the verification process, not a method to confirm log ingestion after verification.

\* D. Retrieve device certificate from NGFW dashboard: Retrieving the device certificate from the NGFW dashboard is unrelated to confirming log ingestion in Cortex XDR. Certificates are managed during setup, not for post-onboarding validation.

Exact Extract or Reference:

The Cortex XDR Documentation Portal explains NGFW log ingestion validation: "To confirm successful ingestion of Palo Alto

Networks NGFW logs, run an XQL query (e.g., dataset = panw\_ngfw\_logs) to verify that log data is present in Cortex XDR" (paraphrased from the Data Ingestion section). The EDU-260: Cortex XDR Prevention and Deployment course covers NGFW integration, stating that "XQL queries are used to validate that NGFW logs are being ingested after onboarding" (paraphrased from course materials). The Palo Alto Networks Certified XDR Engineer datasheet includes "data ingestion and integration" as a key exam topic, encompassing log ingestion validation.
