The customizable mock tests make an image of a real-based Google Associate Cloud Engineer Exam (Associate-Cloud-Engineer) exam which is helpful for you to overcome the pressure of taking the final examination. Customers of Prep4away can take multiple Google Associate-Cloud-Engineer practice tests and improve their preparation to achieve the Associate-Cloud-Engineer Certification. You can even access your previously given tests from the history, which allows you to be careful while giving the mock test next time and prepare for Google Associate-Cloud-Engineer certification in a better way.

To take the exam, candidates need to have practical experience using GCP services and must understand the basic principles of cloud computing. Associate-Cloud-Engineer Exam consists of multiple-choice and multiple-select questions, and candidates have two hours to complete it. The passing score for the exam is 70%, and the certification is valid for two years.

Top Reliable Associate-Cloud-Engineer Exam Question - High-quality Associate-Cloud-Engineer Exam Tool Guarantee Purchasing Safety

We are all ordinary human beings. Something what have learned not completely absorbed, so that we often forget. When we need to use the knowledge we must learn again. When you see Prep4away's Google Associate-Cloud-Engineer Exam Training materials, you understand that this is what you have to be purchased. It allows you to pass the exam effortlessly. You should believe Prep4away will let you see your better future. Bright hard the hard as long as Prep4away still, always find hope. No matter how bitter and more difficult, with Prep4away you will still find the hope of light.

Google Associate Cloud Engineer Exam Sample Questions (Q22-Q27):

NEW QUESTION # 22

Your company publishes large files on an Apache web server that runs on a Compute Engine instance. The Apache web server is not the only application running in the project. You want to receive an email when the egress network costs for the server exceed 100 dollars for the current month as measured by Google Cloud Platform (GCP). What should you do?

- A. Set up a budget alert on the billing account with an amount of 100 dollars, a threshold of 100%, and notification type of "email."
- B. Export the billing data to BigQuery. Create a Cloud Function that uses BigQuery to sum the egress network costs of the exported billing data for the Apache web server for the current month and sends an email if it is over 100 dollars. Schedule the Cloud Function using Cloud Scheduler to run hourly.
- C. Set up a budget alert on the project with an amount of 100 dollars, a threshold of 100%, and notification type of "email."
- D. Use the Stackdriver Logging Agent to export the Apache web server logs to Stackdriver Logging. Create a Cloud

Function that uses BigQuery to parse the HTTP response log data in Stackdriver for the current month and sends an email if the size of all HTTP responses, multiplied by current GCP egress prices, totals over 100 dollars. Schedule the Cloud Function using Cloud Scheduler to run hourly.

Answer: D

NEW QUESTION # 23

A company wants to build an application that stores images in a Cloud Storage bucket and wants to generate thumbnails as well as resize the images. They want to use a google managed service that can scale up and scale down to zero automatically with minimal effort. You have been asked to recommend a service. Which GCP service would you suggest?

- A. Google Kubernetes Engine
- B. Google App Engine
- **C. Cloud Functions**
- D. Google Compute Engine

Answer: C

Explanation:

Text Description automatically generated with low confidence

Cloud Functions is Google Cloud's event-driven serverless compute platform. It automatically scales based on the load and requires no additional configuration. You pay only for the resources used.

Ref: <https://cloud.google.com/functions>

While all other options i.e. Google Compute Engine, Google Kubernetes Engine, Google App Engine support autoscaling, it needs to be configured explicitly based on the load and is not as trivial as the scale up or scale down offered by Google's cloud functions.

NEW QUESTION # 24

Your organization uses G Suite for communication and collaboration. All users in your organization have a G Suite account. You want to grant some G Suite users access to your Cloud Platform project. What should you do?

- A. In the G Suite console, add the users to a special group called cloud-console- users@yourdomain.com. Rely on the default behavior of the Cloud Platform to grant users access if they are members of this group.
- **B. Grant them the required IAM roles using their G Suite email address.**
- C. Enable Cloud Identity in the GCP Console for your domain.
- D. Create a CSV sheet with all users' email addresses. Use the gcloud command line tool to convert them into Google Cloud Platform accounts.

Answer: B

Explanation:

<https://cloud.google.com/resource-manager/docs/creating-managing-organization>

NEW QUESTION # 25

Your company has developed a new application that consists of multiple microservices. You want to deploy the application to Google Kubernetes Engine (GKE), and you want to ensure that the cluster can scale as more applications are deployed in the future. You want to avoid manual intervention when each new application is deployed. What should you do?

- A. Deploy the application on GKE, and add a HorizontalPodAutoscaler to the deployment.
- B. Create a separate node pool for each application, and deploy each application to its dedicated node pool.

- C. Create a GKE cluster with autoscaling enabled on the node pool. Set a minimum and maximum for the size of the node pool.
- D. Deploy the application on GKE, and add a VerticalPodAutoscaler to the deployment.

Answer: C

Explanation:

https://cloud.google.com/kubernetes-engine/docs/how-to/cluster-autoscaler#adding_a_node_pool_with_autoscaling

NEW QUESTION # 26

You need a dynamic way of provisioning VMs on Compute Engine. The exact specifications will be in a dedicated configuration file. You want to follow Google's recommended practices. Which method should you use?

- A. Managed Instance Group
- B. Deployment Manager
- C. Unmanaged Instance Group
- D. Cloud Composer

Answer: B

Explanation:

Google Cloud Deployment Manager allows you to specify all the resources needed for your application in a declarative format using yaml. You can also use Python or Jinja2 templates to parameterize the configuration and allow reuse of common deployment paradigms such as a load balanced, auto-scaled instance group. Treat your configuration as code and perform repeatable deployments.
