## Fortinet NSE 6 - FortiSwitch 7.2 Sample Questions (Q40-Q45):

### NEW QUESTION # 40

Refer to the exhibit.

Port	Trunk	Access Mode	Enabled Features	Native VLAN	Allowed VLANs	Link	Device Information	DHCP Snooping
Access-1 - S424DPTF20000029								
port1		Normal	Edge Port Spanning Tree Protocol	default	quarantine	Powered	00:e0:4c:36:0ca6	Untrusted
port2		Normal	Edge Port Spanning Tree Protocol	default	quarantine	Powered	5c:85:7e:32:16:a2	Untrusted
port23		Normal	Edge Port Spanning Tree Protocol	S424DPTF20000027		Powered		

The exhibit shows the current status of the ports on the managed FortiSwitch. Access-1.

Why would FortiGate display a serial number in the Native VLAN column associated with the port23 entry?

- A. A standalone switch with the shown serial number is connected on port23.
- B. port23 is configured as the dedicated management interface.
- C. Ports connected to adjacent FortiSwitch devices show their serial number as the native VLAN.
- D. port23 is a member of a trunk that uses the Access-1 FortiSwitch serial number as the name of the trunk.

Answer: A

### NEW QUESTION # 41

Exhibit.

```

Commands

config system interface
  edit "internal"
    set ip 10.0.13.3 255.255.255.0
    set allowaccess ping https ssh snmp
  end
  next
config switch interface
  edit "internal"
    set native-vlan 4094
    set allowed-vlans 4094
  end
  next
config switch interface
  edit "port24"
    set native-vlan 100
    set allowed-vlans 100 200
  end
  next
end

```

port24 is the only uplink port connected to the network where access to FortiSwitch management services is possible. However, FortiSwitch is still not accessible on the management interface. Which two actions should you take to fix the issue and access FortiSwitch? (Choose two.)

- A. You must allow VLAN ID 4094 on port24, if management traffic is tagged.
- B. You must add VLAN ID 200 to the allowed VLANS on internal.
- C. You should use VLAN ID 4094 as the native VLAN on port24.
- D. You must add port24 native VLAN as an allowed VLAN on internal.

Answer: A,C

### NEW QUESTION # 42

How does FortiGate handle configuration of flow tracking sampling if you export the settings to a managed FortiSwitch stack with sampling mode set to perimeter is true?

- A. FortiGate configures and enables egress sampling on all management interfaces.
- B. FortiGate configures FortiSwitch to perform ingress sampling on all switch interfaces.
- C. FortiGate configures and enables flow sampling on FortiSwitch but does not change existing sampling settings of interfaces.
- D. FortiGate configures FortiSwitch to perform ingress sampling on all switch interfaces, except ICL and ISL interfaces.

Answer: D

Explanation:

When FortiGate exports configuration settings to a managed FortiSwitch stack with sampling mode set to "perimeter is true," the behavior is:

B . FortiGate configures FortiSwitch to perform ingress sampling on all switch interfaces, except ICL and ISL interfaces. This setting ensures that all incoming traffic on normal operational ports is sampled for monitoring and analysis purposes, but it excludes the inter-chassis link (ICL) and inter-switch link (ISL) interfaces from sampling. These exclusions are typically made to prevent the duplication of sampled data and to reduce unnecessary load on the monitoring system, as these links often carry traffic already monitored at other points.

Options A and D are incorrect because they either generalize the sampling across all interfaces without exceptions or incorrectly specify egress sampling on management interfaces. Option C is also incorrect as FortiGate can modify existing sampling settings to fit the perimeter-based configuration requirement.

#### NEW QUESTION # 43

How is traffic routed on FortiSwitch?

- A. ASIC hardware routing can only handle dynamic routing, if supported.
- B. Hardware-based routing on FortiSwitch is handled by the CPU.
- C. Layer 3 routing can be configured on FortiSwitch, while managed by FortiGate.
- D. FortiSwitch looks up the hardware routing table and then the forwarding information base (FIB).

**Answer: C**

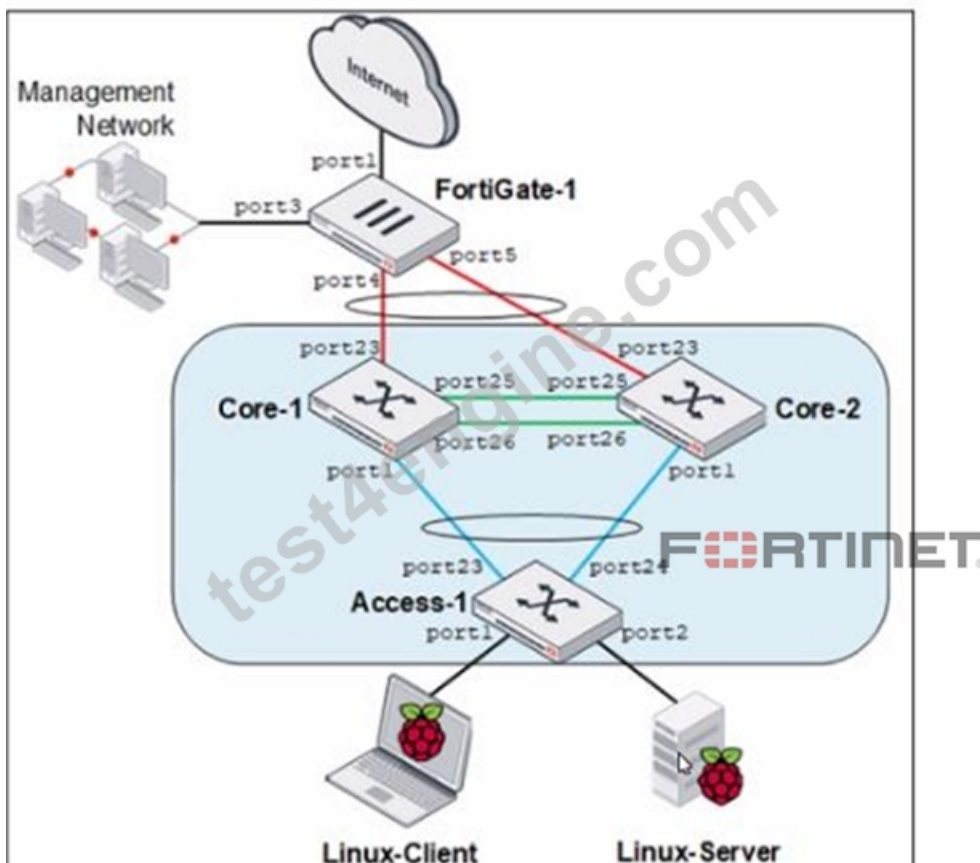

Explanation:

Layer 3 routing can be configured on FortiSwitch, while managed by FortiGate (D): FortiSwitch, when managed by FortiGate, supports Layer 3 routing capabilities. This allows for routing between VLANs directly on the switch, enhancing network efficiency by reducing the need to pass traffic through higher network layers for inter-VLAN communication. This configuration enables more sophisticated network setups and efficient routing directly at the switch level.

#### NEW QUESTION # 44

Refer to the exhibit.

MCL-Topology

Core-1 and Access-1 are managed and authorized by FortiGate-1, which uses port4 as the FortiLink interface. After FortiGate authorizes and manages Core-2, Port1 status becomes STP discarding.  
Why is port1 in the discarding state?

- A. Core-2 has the lowest bridge priority.
- B. port1 on Core-2 is discarding only management traffic.
- **C. Core-1 and Core-2 do not have MCLAG configuration.**
- D. Access-1 is the root bridge and can only have one root port.

**Answer: C**

Explanation:

The STP (Spanning Tree Protocol) discarding state on port1 of Core-2, after Core-1 and Access-1 are managed and authorized by FortiGate-1, is likely due to the lack of an MCLAG (Multi-Chassis Link Aggregation Group) configuration between Core-1 and Core-2. In typical network configurations involving STP and MCLAG, the absence of MCLAG can lead to STP blocking one of the redundant paths to prevent loops, which is a critical function of STP. Port1 on Core-2 being in a discarding state suggests that it has been identified as providing a redundant path that could potentially create a network loop, hence STP has placed this port in a blocking (discarding) state to maintain a loop-free topology.
