This age changes quickly, so we can't be passively, we should be actively to follow the age. When you choose to participate in C_ABAPD_2309 exam, you are proved to be an active person who wants better development opportunities for yourself. Our VCETorrent is willing to help those active people like you to achieve their goals. The most comprehensive and Latest C_ABAPD_2309 Exam Materials provided by us can meet all your need to prepare for C_ABAPD_2309 exam.

Our C_ABAPD_2309 exam questions are related to test standards and are made in the form of actual tests. Whether you are newbie or experienced exam candidates, our C_ABAPD_2309 study guide will relieve you of tremendous pressure and help you conquer the difficulties with efficiency. If you study with our C_ABAPD_2309 Practice Engine for 20 to 30 hours, we can claim that you can pass the exam as easy as a pie. Why not have a try?

C_ABAPD_2309 Valuable Feedback - Cert C_ABAPD_2309 Guide

Are you still satisfied with your present job? Do you still have the ability to deal with your job well? Do you think whether you have the competitive advantage when you are compared with people working in the same field? If your answer is no, you are a right place now. Because our C_ABAPD_2309 exam torrent will be your good partner and you will have the chance to change your work which you are not satisfied with, and can enhance your ability by our C_ABAPD_2309 Guide questions, you will pass the C_ABAPD_2309 exam and achieve your target. Just free download the demo of our C_ABAPD_2309 exam questions!

SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q43-Q48):

NEW QUESTION # 43

```
1  Given this code,  
2  DATA: go_super TYPE REF TO lcl_super,  
3         go_sub1  TYPE REF TO lcl_sub1.  
4  ...  
5  go_sub1 = CAST #( go_super ).  
6  go_sub1_meth1(...).  
7
```

with which predicate condition can you ensure that the CAST will work?

- A. IS BOUND

- B. IS SUPPLIED
- **C. IS INSTANCE OF**
- D. IS NOT INITIAL

Answer: C

Explanation:

The predicate condition that can be used to ensure that the CAST will work is IS INSTANCE OF. The IS INSTANCE OF predicate condition checks whether the operand is an instance of the specified class or interface. This is useful when you want to perform a downcast, which is a conversion from a more general type to a more specific type. A downcast can fail if the operand is not an instance of the target type, and this can cause a runtime error. Therefore, you can use the IS INSTANCE OF predicate condition to check whether the downcast is possible before using the CAST operator¹². For example:

* The following code snippet uses the IS INSTANCE OF predicate condition to check whether the variable g_super is an instance of the class lcl_super. If it is, the CAST will work and the variable g_sub1 will be assigned the value of g_super.

DATA: g_super TYPE REF TO lcl_super, g_sub1 TYPE REF TO lcl_sub1. IF g_super IS INSTANCE OF lcl_super. g_sub1 = CAST #(g_super). g_sub1->method(...). ENDIF.

You cannot do any of the following:

* IS SUPPLIED: The IS SUPPLIED predicate condition checks whether an optional parameter of a method or a function module has been supplied by the caller. This is useful when you want to handle different cases depending on whether the parameter has a value or not. However, this predicate condition has nothing to do with the CAST operator or the type of the operand¹².

* IS NOT INITIAL: The IS NOT INITIAL predicate condition checks whether the operand has a non- initial value. This is useful when you want to check whether the operand has been assigned a value or not. However, this predicate condition does not guarantee that the CAST will work, because the operand may have a value but not be an instance of the target type¹².

* IS BOUND: The IS BOUND predicate condition checks whether the operand is a bound reference variable. This is useful when you want to check whether the operand points to an existing object or not. However, this predicate condition does not guarantee that the CAST will work, because the operand may point to an object but not be an instance of the target type¹².

NEW QUESTION # 44

What would be the correct expression to change a given string value 'mr joe doe' into 'JOE' in an ABAP SQL field list?

- A. SELECT FROM TABLE dbtabl FIELDS
Of1,
left(lower(substring('mr joe doe', 4, 3)), 3) AS f2_left_lo_sub, f3,
- **B. SELECT FROM TABLE dbtabl FIELDS
Of1,
substring(upper('mr joe doe'), 4, 3) AS f2_sub_up, f3,...**
- C. SELECT FROM TABLE dbtabl FIELDS
Of1,
upper(left('mr joe doe', 6)) AS f2_up_left, f3,
- D. SELECT FROM TABLE dbtabl FIELDS
Of1,
substring(lower(upper('mr joe doe')), 4, 3) AS f2_sub_lo_up, f3,

Answer: B

Explanation:

The correct expression to change a given string value 'mr joe doe' into 'JOE' in an ABAP SQL field list is C: SELECT FROM TABLE dbtabl FIELDS Of1, substring(upper('mr joe doe'), 4, 3) AS f2_sub_up, f3,...

This expression uses the following SQL functions for strings¹²:

* upper: This function converts all lowercase characters in a string to uppercase. For example, upper('mr joe doe') returns 'MR JOE DOE'.

* substring: This function returns a substring of a given string starting from a specified position and with a specified length. For example, substring('MR JOE DOE', 4, 3) returns 'JOE'.

* AS: This keyword assigns an alias or a temporary name to a field or an expression in the field list. For example, AS f2_sub_up assigns the name f2_sub_up to the expression substring(upper('mr joe doe'), 4, 3).

You cannot do any of the following:

* A. SELECT FROM TABLE dbtabl FIELDS Of1, upper(left('mr joe doe', 6)) AS f2_up_left, f3,....:

This expression uses the wrong SQL function for strings to get the desired result. The left function returns the leftmost characters of a string with a specified length, ignoring the trailing blanks. For example, left('mr joe doe', 6) returns 'mr joe'. Applying the upper function to this result returns 'MR JOE', which is not the same as 'JOE'.

* B. SELECT FROM TABLE dbtabl FIELDS Of1, left(lower(substring('mr joe doe', 4, 3)), 3) AS f2_left_lo_sub, f3,...: This expression uses unnecessary and incorrect SQL functions for strings to get the desired result. The lower function converts all uppercase characters in a string to lowercase. For example, lower(substring('mr joe doe', 4, 3)) returns 'joe'. Applying the left function to this result with the same length returns 'joe' again, which is not the same as 'JOE'.

* D. SELECT FROM TABLE dbtabl FIELDS Of1, substring(lower(upper('mr joe doe')), 4, 3) AS f2_sub_lo_up, f3,...: This expression uses unnecessary and incorrect SQL functions for strings to get the desired result. The lower function converts all uppercase characters in a string to lowercase, and the upper function converts all lowercase characters in a string to uppercase. Applying both functions to the same string cancels out the effect of each other and returns the original string. For example, lower(upper('mr joe doe')) returns 'mr joe doe'. Applying the substring function to this result returns 'joe', which is not the same as 'JOE'.

NEW QUESTION # 45

Which of the following are ABAP Cloud Development Model rules?

Note: There are 2 correct answers to this question.

- A. Reverse modifications when a suitable public SAP API becomes available.
- B. Build ABAP RESTful application programming model-based services.
- C. Build ABAP reports with either ABAP List Viewer (ALV) or SAP Fiori.
- D. Use public SAP APIs and SAP extension points.

Answer: A,D

Explanation:

* Use public SAP APIs and SAP extension points. This rule ensures that the ABAP Cloud code is stable, reliable, and compatible with the SAP solutions and the cloud operations. Public SAP APIs and SAP extension points are the only allowed interfaces and objects to access the SAP platform and the SAP applications. They are documented, tested, and supported by SAP. They also guarantee the lifecycle stability and the upgradeability of the ABAP Cloud code1.

* Build ABAP RESTful application programming model-based services. This rule ensures that the ABAP Cloud code follows the state-of-the-art development paradigm for building cloud-ready business services. The ABAP RESTful application programming model (RAP) is a framework that provides a consistent end-to-end programming model for creating, reading, updating, and deleting (CRUD) business data. RAP also supports draft handling, authorization checks, side effects, validations, and custom actions. RAP exposes the business services as OData services that can be consumed by SAP Fiori apps or other clients2.

NEW QUESTION # 46

Refer to the Exhibit.

```
1 Given this code
2 DATA: go_super TYPE REF TO lcl_super,
3       go_sub1  TYPE REF TO lcl_sub1.
4 ...
5 go_sub1 = CAST #( go_super ).
6 go_sub1->sub1_meth1(...).
7
```

with which predicate condition can you ensure that the CAST will work?

- A. IS BOUND
- B. IS SUPPLIED
- C. IS INSTANCE OF
- D. IS NOT INITIAL

Answer: C

Explanation:

The predicate condition that can be used to ensure that the CAST will work is IS INSTANCE OF. The IS INSTANCE OF

predicate condition checks whether the operand is an instance of the specified class or interface. This is useful when you want to perform a downcast, which is a conversion from a more general type to a more specific type. A downcast can fail if the operand is not an instance of the target type, and this can cause a runtime error. Therefore, you can use the IS INSTANCE OF predicate condition to check whether the downcast is possible before using the CAST operator¹². For example:

The following code snippet uses the IS INSTANCE OF predicate condition to check whether the variable g_super is an instance of the class lc1_super. If it is, the CAST will work and the variable g_sub1 will be assigned the value of g_super.

```
DATA: g_super TYPE REF TO lc1_super, g_sub1 TYPE REF TO lc1_sub1. IF g_super IS INSTANCE OF lc1_super. g_sub1 = CAST #( g_super ). g_sub1->method( ... ). ENDIF.
```

You cannot do any of the following:

IS SUPPLIED: The IS SUPPLIED predicate condition checks whether an optional parameter of a method or a function module has been supplied by the caller. This is useful when you want to handle different cases depending on whether the parameter has a value or not. However, this predicate condition has nothing to do with the CAST operator or the type of the operand¹².

IS NOT INITIAL: The IS NOT INITIAL predicate condition checks whether the operand has a non-initial value. This is useful when you want to check whether the operand has been assigned a value or not. However, this predicate condition does not guarantee that the CAST will work, because the operand may have a value but not be an instance of the target type¹².

IS BOUND: The IS BOUND predicate condition checks whether the operand is a bound reference variable. This is useful when you want to check whether the operand points to an existing object or not. However, this predicate condition does not guarantee that the CAST will work, because the operand may point to an object but not be an instance of the target type¹².

NEW QUESTION # 47

In which products must you use the ABAP Cloud Development Model? Note: There are 2 correct answers to this question.

- A. SAP S/4HANA Cloud, private edition
- B. SAP S/4HANA Cloud, public edition
- C. SAP S/4HANA on premise
- D. SAP BTP, ABAP environment

Answer: A,D

Explanation:

The ABAP Cloud Development Model is the ABAP development model to build cloud-ready business apps, services, and extensions. It comes with SAP BTP and SAP S/4HANA. It works with public or private cloud, and even on-premise¹. However, the complete ABAP Cloud Development Model, including the cloud-optimized ABAP language and public local SAP APIs and extension points, is available only in SAP BTP ABAP Environment and in the 2208/2022 versions of the SAP S/4HANA editions¹. Therefore, you must use the ABAP Cloud Development Model in SAP BTP, ABAP environment and SAP S/4HANA Cloud, private edition. You can also use it in SAP S/4HANA on premise, but it is not mandatory. You cannot use it in SAP S/4HANA Cloud, public edition, because it does not allow custom ABAP code².
