The customizable mock tests make an image of a real-based VMware Cloud Foundation 5.2 Administrator (2V0-11.25) exam which is helpful for you to overcome the pressure of taking the final examination. Customers of Pass4Test can take multiple VMware Cloud Foundation 5.2 Administrator (2V0-11.25) practice tests and improve their preparation to achieve the 2V0-11.25 Certification. You can even access your previously given tests from the history, which allows you to be careful while giving the mock test next time and prepare for VMware Cloud Foundation 5.2 Administrator (2V0-11.25) certification in a better way.

It will improve your skills to face the difficulty of the 2V0-11.25 exam questions and accelerate the way to success in IT filed with our latest study materials. Free demo of our 2V0-11.25 dumps pdf can be downloaded before purchase and 24/7 customer assisting support can be access. Well preparation of 2V0-11.25 Practice Test will be closer to your success and get authoritative certification easily.

2V0-11.25 Prep Guide: VMware Cloud Foundation 5.2 Administrator - Trustable VMware 2V0-11.25 Latest Torrent

As a working person, the VMware 2V0-11.25 practice exam will be a great help because you are left with little time to prepare for the VMware 2V0-11.25 certification exam which you cannot waste to make time for the VMware 2V0-11.25 Exam Questions. You can find yourself sitting in your dream office and enjoying the new opportunity.

VMware Cloud Foundation 5.2 Administrator Sample Questions (Q33-Q38):

NEW QUESTION # 33
An administrator is unable to log in to the SDDC Manager UI on their local workstation. After entering the correct URL, the login page does not load and the administrator is unable to enter their credentials in order to view the SDDC Manager inventory. They confirm that the SDDC Manager appliance responds to a ping command from their local workstation against both its FQDN and IP address.
After checking the VM console of the SDDC Manager appliance in the management vCenter UI, they determine that the operating system is online and they can log in to it with the relevant administrator level accounts.
What two actions could the administrator take whilst logged in to the SDDC Manager VM via the VM console to help identify the root cause of the UI not loading? (Choose two.)

- A. Perform a restart of the services using the command systemctl restart.
- B. Perform a restart of the network adapter using the command systemctl restart.
- C. Verify the health of the SDDC Manager services using the command sos --get-vcf-services-summary.
- D. Verify that port 80 is open and listening for connections using the command netstat.
- E. Verify that there is free disk space remaining using the command df -h.

Answer: C,E

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
According to the VMware Cloud Foundation 5.2 Administration Guide and troubleshooting documentation, when the SDDC Manager UI does not load even though the appliance is reachable and online, administrators should check both the health of services and the system resources. Here's the detailed reasoning and exact documentation extracts:
Option C: Verify the health of the SDDC Manager services using the command sos --get-vcf-services-summary.
Official documentation states:
"You can check the status of SDDC Manager services by running the sos command on the SDDC Manager VM. This command provides a summary of all SDDC Manager services and their current state. If any service is stopped or unhealthy, this may prevent the UI from loading." Reference:
Option E: Verify that there is free disk space remaining using the command df -h.
Official documentation specifies:
"If the SDDC Manager appliance runs out of disk space, the UI and related services may become unresponsive. Use the df -h command to check for available disk space on the appliance." Why Not the Other Options?
Option A: Port 80 is not used for the SDDC Manager UI; the UI listens on port 443 (HTTPS).
Option B and D: Restarting the network adapter or services without first identifying the root cause is not a recommended troubleshooting step according to the official documentation.
Summary:
The administrator should check the SDDC Manager services health (C) and ensure there is free disk space (E) on the appliance, as recommended by the VMware official documentation for troubleshooting UI access issues in VMware Cloud Foundation 5.2.

NEW QUESTION # 34
Following an update to the Information Security policy, an administrator has been reviewing the status SSL certificates within the VMware Cloud Foundation (VCF) solution.
The new Information Security Policy states:
All SSL certificates must be generated and signed from the shared Microsoft Certificate Authority (CA).
The administrator has discovered the following:
All Aria Suite Components already use CA-signed Subject Alternate Name (SAN) SSL certificates.
All other VCF-based SSL certificates are either self-signed or generated using the VMware Certificate Authority (VMCA).
Which three steps must the administrator take to ensure the VCF solution remains compliant and managed by SDDC Manager? (Choose three.)

- A. In SDDC Manager, replace the SSL certificates for vCenter, NSX Manager, SDDC Manager and Aria Suite Lifecycle.
- B. In SDDC Manager, replace the SSL certificates for vCenter, ESXi, NSX Manager, SDDC Manager and Aria Suite Lifecycle.
- C. Integrate the OpenSSL CA into SDDC Manager.

- D. In Aria Suite Lifecycle, replace the VMware Identity Manager, Aria Automation, Aria Operations and Aria Operations for Logs SSL certificates.
- E. In VMware vCenter, replace the ESXi SSL certificates.
- F. Integrate the Microsoft CA into SDDC Manager.

Answer: A,B,F

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
As per the VMware Cloud Foundation Administration Guide, the official and supported process for moving all solution certificates under a Microsoft Certificate Authority, while keeping management and lifecycle operations compliant with SDDC Manager, is as follows:
C . Integrate the Microsoft CA into SDDC Manager.
Exact Extract:
"To replace SSL certificates for VMware Cloud Foundation components using SDDC Manager, you must first integrate your Microsoft CA with SDDC Manager. This allows SDDC Manager to automate the certificate signing process using the organization's enterprise CA." F . In SDDC Manager, replace the SSL certificates for vCenter, ESXi, NSX Manager, SDDC Manager and Aria Suite Lifecycle.
Exact Extract:
"With Microsoft CA integration, you can use SDDC Manager to generate and replace SSL certificates for all key solution components, including vCenter, ESXi, NSX Manager, SDDC Manager, and Aria Suite Lifecycle. This process ensures full visibility and management through SDDC Manager." D . In SDDC Manager, replace the SSL certificates for vCenter, NSX Manager, SDDC Manager and Aria Suite Lifecycle.
Exact Extract:
"Certificate replacement workflows in SDDC Manager allow you to select which managed components have their certificates replaced with CA-signed certificates. You must select and update all components that are not already using compliant CA-signed certificates." Why Not the Other Options?
A: ESXi certificate replacement should be managed via SDDC Manager for compliance, not directly in vCenter.
B: OpenSSL CA is not part of the company's security policy or supported by the current workflow.
E: Aria Suite Lifecycle and its components already use CA-signed certificates, so this action is not needed.
Summary:
To ensure compliance with the updated security policy and maintain management with SDDC Manager, the administrator must:
Integrate the Microsoft CA into SDDC Manager (C),
Use SDDC Manager to replace all relevant solution SSL certificates for vCenter, ESXi, NSX Manager, SDDC Manager, and Aria Suite Lifecycle (F), And use SDDC Manager's certificate replacement workflow to update any components still requiring CA-signed certificates (D).
These steps are mandated and supported by VMware Cloud Foundation official documentation.

NEW QUESTION # 35
An Administrator is configuring the network within their VCF management domain in preparation to deploy VMware Aria Suite Lifecycle.
What are the two types of virtual networks that the Administrator could configure to support the deployment?
(Choose two.)

- A. VLAN-backed NSX Segments
- B. Overlay-backed NSX Segments
- C. VXLAN-backed Network Pools
- D. VLAN-backed Port Groups

Answer: B,D

Explanation:
VLAN-backed Port Groups are used in traditional network environments where VLANs are configured on the physical switches. These port groups can be configured in the management domain to support network connectivity.
Overlay-backed NSX Segments use NSX to create virtual networks overlaid on existing physical networks, which is essential for network virtualization and communication between virtual machines, especially in a VMware Cloud Foundation environment.

NEW QUESTION # 36
Following an internal security audit of the new VMware Cloud Foundation (VCF) instance, the following audit finding was

documented for priority remediation:

All users from the custom administrators group could access the Direct Console User Interface (DCUI) on all ESXi hosts within the workload domain. RISK=High, IMPACT=High The company IT security policy around accessing ESXi servers states the following:

Users within the custom administrators group must access ESXi host configurations from within vCenter Server or the vSphere Web Client only.

Only users within the restricted administrators group must be allowed direct access to ESXi hosts.

Which two actions should the administrator perform on each of the hosts within the workload domain to remediate the security finding? (Choose two.)

- A. Enable Normal Lockdown Mode.
- B. Enable Strict Lockdown Mode.
- C. Disable SSH and the ESXi Shell.
- D. Add the custom administrators group to the DCUI.Access advanced system setting.
- E. Add the restricted administrators group to the DCUI.Access advanced system setting.

Answer: A,E

Explanation:

https://techdocs.broadcom.com/us/en/vmware-cis/vsphere/vsphere/8-0/vsphere-security-8-0/securing-esxi- hosts/customizing-hosts-with-the-security-profile/lockdown-mode.html

NEW QUESTION # 37

An administrator needs to delete and re-deploy an NSX Edge cluster that was originally deployed from SDDC Manager and has downloaded the edge cleaner tool.

Where should the administrator run the tool to complete this task?

- A. On the SDDC Manager VM.
- B. On the Edge cluster node VM(s).
- C. On the NSX Manager VM.
- D. On the Cloud Builder VM.

Answer: B

Explanation:

The NSX Edge Cleaner tool is typically run on the Edge cluster node VM(s) to clean up the previous configuration and ensure that the node(s) are properly removed before re-deploying the NSX Edge cluster.

This process helps to reset the environment and remove any leftover configurations that may affect the re- deployment.
