Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q40-Q45):

NEW QUESTION # 40

What is an advantage that Anypoint Platform offers by providing universal API management and Integration-Platform-as-a-Service (iPaaS) capabilities in a unified platform?

- A. Ability to use a single iPaaS to manage and integrate all API gateways
- B. Ability to use a single iPaaS to manage all API developer portals
- C. Ability to use a single control plane for both full-lifecycle API management and integration
- D. Ability to use a single connector to manage and integrate all APIs

Answer: C

Explanation:

Unified Platform: Many vendors offer either API Management (APIM) or Integration (iPaaS) as separate tools. Anypoint Platform combines them.

Single Control Plane: The primary advantage is having a single interface (The Anypoint Control Plane) where you can do everything: design APIs, build integrations, deploy them, govern them with policies, and monitor them.
Impact: This reduces complexity, lowers costs (no need to buy two separate stacks), and streamlines the workflow from development to operations.

NEW QUESTION # 41

A developer is examining the responses from a RESTful web service that is compliant with the Hypertext Transfer Protocol (HTTP/1.1) as defined by the Internet Engineering Task Force (IETF). 13 (The question asks to identify the code class for success)

- A. 4xx
- **B. 2xx**
- C. 3xx
- D. 5xx

Answer: B

Explanation:

Comprehensive and Detailed Explanation:

HTTP Status Codes: Understanding these is fundamental to MuleSoft integration.

2xx (Success - Answer B): The request was received, understood, and accepted. (e.g., 200 OK, 201 Created, 202 Accepted).

3xx (Redirection): Further action needs to be taken to complete the request (e.g., 301 Moved Permanently).

4xx (Client Error): The request contains bad syntax or cannot be fulfilled (e.g., 400 Bad Request, 401 Unauthorized, 404 Not Found).

5xx (Server Error): The server failed to fulfill an apparently valid request (e.g., 500 Internal Server Error, 502 Bad Gateway).

Context: When a Mule flow makes an HTTP Request, it checks these status codes to determine if the On Error scope should be triggered. By default, 4xx and 5xx trigger errors; 2xx indicates success.

NEW QUESTION # 42

An API client makes an HTTP request to an API gateway with an Accept header containing the value "application/json".

- A. `status('healthy')`
- **B. `{"status": "healthy"}`**
- C. `status: healthy`
- D. `status>healthy</status>`

Answer: B

Explanation:

Content Negotiation: The HTTP Accept header is used by the client to tell the server what media type (format) it expects in the response.

application/json: This MIME type explicitly requests JSON (JavaScript Object Notation).

Analyzing the Options:

(B) `{"status": "healthy"}` is valid JSON format (Key-Value pair wrapped in braces).

(C) `status>healthy</status>` is XML.

(A) is YAML or Plain Text.

NEW QUESTION # 43

Which Anypoint Platform component should a MuleSoft developer use to create an API specification prior to building the API implementation?

- **A. API Designer**
- B. Runtime Manager
- C. MDint (Likely typo in PDF, refers to MUnit or similar tools)
- D. API Manager

Answer: A

Explanation:

Design-First Approach: The lifecycle starts with Design.

API Designer: This is the web-based tool within Design Center where developers write the API contract using RAML (RESTful API Modeling Language) or OAS (OpenAPI Specification). 9 Functionality: It provides syntax highlighting, error checking, and a "Mocking Service" that allows you to test the API's behavior before writing any actual code.

Why others are incorrect:

API Manager: Used after design to manage policies and gateways.

Runtime Manager: Used after build to deploy the application.

NEW QUESTION # 44

A developer needs to discover which API specifications have been created within the organization before starting a new project.

- A. Object Store2
- B. Runtime Manager
- C. Anypoint Exchange
- D. API Manager

Answer: C

Explanation:

4

Anypoint Exchange: This is the central repository and knowledge base of the Anypoint Platform. It is designed specifically for Discovery and Reuse. 6 The Workflow: Before building a new integration, a developer searches Exchange to see if an Asset (API Specification, Fragment, Connector, or Template) already exists. This prevents duplication of effort—a core tenet of the API-led connectivity approach.

Why others are incorrect:

Runtime Manager: Used for deploying and monitoring running applications.

API Manager: Used for applying policies and governing APIs, not primarily for discovery by developers.

Object Store: A mechanism for storing data/state within a Mule application.
