I believe that people want to have good prospects of career whatever industry they work in. Of course, there is no exception in the competitive IT industry. IT Professionals working in the IT area also want to have good opportunities for promotion of job and salary. A lot of IT professional know that Talend Certification Talend-Core-Developer Exam can help you meet these aspirations. ExamCost is a website which help you successfully pass Talend Talend-Core-Developer.

Talend Core Certified Developer Exam Sample Questions (Q42-Q47):

NEW QUESTION # 42

You have a MySQL table named customers with columns named id, name, address, and country. You need to retrieve records that have a specific country based on a variable. Which steps should you use to achieve this?

- A. Use a tDBInput component with a context variable in the SQL query.
- B. Use a tDBInput component with a Run if trigger.
- C. Use a tDBInput component and link it to a tMatchGroup component.
- D. Use a tDBInput component and link it to a tFilterColumns component.

Answer: A

Explanation:

Comprehensive and Detailed Explanation:

To filter records based on a specific country dynamically, the best approach is using a tDBInput component with a context variable in the SQL query (Option A).

Step-by-Step Process:

- * Define a Context Variable:
 - * In the Context Variables section of Talend Studio, create a new variable (context.country) and set its value dynamically.
- * Configure tDBInput:
 - * Drag and drop the tDBInput component onto the Designer.
 - * Set up the database connection using either Built-in or Repository mode.
- * In the Query field, write:

```
SELECT id, name, address, country FROM customers WHERE country = '" + context.country + "'
```
- * Execute the Job:
 - * The Job will retrieve only those records where the country column matches the value of the context variable.
 - * The value of context.country can be modified at runtime, making the query dynamic.
- Why not other options?
 - * tMatchGroup (Option B): Used for record deduplication, not filtering.
 - * Run if Trigger (Option C): Controls execution flow but does not filter records inside tDBInput.
 - * tFilterColumns (Option D): Removes unwanted columns but does not filter records based on conditions.

NEW QUESTION # 43

What are the key capabilities of Talend Cloud Data Preparation that improve data quality and accessibility?

Choose 2 answers

- A. Cleanse data
- B. Transform
- C. Discover
- D. Standardize data

Answer: A,D

NEW QUESTION # 44

You can initialize your component endpoint, API mappings, and documentation from your API definition.

Which API definitions are supported by tRESTRequest?

- A. CSV definition file
- B. OAS/Swagger 2.0 file
- C. WSDL file
- D. XML definition file

Answer: B

Explanation:

Comprehensive and Detailed Explanation:

The tRESTRequest component supports OpenAPI Specification (OAS)/Swagger 2.0 for initializing component endpoints, API mappings, and documentation.

- * OAS/Swagger 2.0 file (Correct Answer - Option D):
 - * tRESTRequest allows API-first development by importing a Swagger 2.0 (OAS) definition.
 - * This enables automatic configuration of API endpoints, request parameters, and response structures.
- * Why not other options?
 - * CSV definition file (Option A): Not a valid API definition format.
 - * XML definition file (Option B): XML files are not standard for REST API definitions.
 - * WSDL file (Option C): WSDL is used for SOAP-based web services, not REST.

NEW QUESTION # 45

How do you create an empty Joblet?

- A. Right-clicking a space in the Designer and select refactor to Joblet.
- B. Right-click Joblet Designs the Repository and select Create Joblet.
- C. Create an empty Job, then export it as a Joblet by right-clicking it in the Repository.
- D. Create an empty Job and use the file menu to save it as Joblet.

Answer: B

Explanation:

To create an empty Joblet, you need to right-click on the Joblet Designs node in the Repository tree view and select Create Joblet option. This will open a dialog box where you can enter the name and description of your Joblet and select an icon for it. You can then design your Joblet by adding components and links to it in the Designer workspace.

You cannot create an empty Joblet by creating an empty job, then exporting it as a Joblet by right-clicking it in the Repository, creating an empty job and using the file menu to save it as Joblet, or right-clicking a space in the Designer and selecting refactor to Joblet. These methods are not available in Talend Studio and may cause errors or unexpected results. References: Talend Open Studio: Open-source ETL and Free Data Integration | Talend, [Joblets - 7.3]

NEW QUESTION # 46

You are designing a Job that can run in two contexts, Test and Production. You want to run it as a standalone job outside Talend Studio.

How do you accomplish this?

- A. Build the Job with the Context scripts option selected in the Build Job windows. Before running the Job, edit the script according to the context in which you want to run the job.
- B. **Build the Job with the desired context selected in the Build Job windows. Build a separate copy if you need to run the Job in a different context.**
- C. Build the Job with the Context scripts option selected in the Build Job windows. You will be prompted for the context.
- D. Set the desired context as the default, then build the Job. Rebuild the Job if you need to run it in a different context.

Answer: B

Explanation:

To design a job that can run in two contexts, Test and Production, and run it as a standalone job outside Talend Studio, you need to do the following steps:

* Define the context variables and values for each context in the Contexts tab of your job. A context variable is a variable that can store a value that can be changed at runtime or between different contexts.

You can use context variables to parameterize the properties or expressions of your job components.

* Build the job with the desired context selected in the Build Job window. You can access this option by right-clicking on your job in the Repository tree view and selecting Build Job. This will open a dialog box where you can configure the build settings, such as destination folder, archive name, context, etc.

You need to select the context that you want to use for your job execution from the drop-down menu.

* Extract the content of the archive file that contains your job executable files and libraries. The archive file also contains two executable files: a batch file (.bat) for Windows platforms and a shell script (.sh) for Linux platforms. You need to run the appropriate file for your platform by double-clicking on it or using a command line tool. This will launch the job and display its output in a console window.

* If you need to run the job in a different context, you need to build a separate copy of the job with the other context selected in the Build Job window. You cannot change the context of an already built job without rebuilding it.

You do not need to build the job with the Context scripts option selected in the Build Job window, edit the script according to the context in which you want to run the job, set the desired context as the default, rebuild the job if you need to run it in a different context, or be prompted for the context. These methods are not correct or available in Talend Studio and may cause errors or unexpected results.
