

Pass Guaranteed Authoritative Amazon - SAA-C03 - Exam AWS Certified Solutions Architect - Associate Overview

P.S. Free 2025 Amazon SAA-C03 dumps are available on Google Drive shared by PracticeDump: <https://drive.google.com/open?id=1ca6DUypGZaw0Yqgu5be8ogw3xZX582Je>

Our SAA-C03 test questions can help you have a good preparation for exam effectively. Also you don't need to worry about if our SAA-C03 study materials are out of validity. We provide one year free updates for every buyer, after purchasing you can download our latest version of SAA-C03 Training Questions always within one year. And if you have any question on our SAA-C03 learning guide, you can contact with our service at any time, we will help you pass the SAA-C03 exam with our high quality of SAA-C03 exam questions and good service.

Amazon AWS Certified Solutions Architect - Associate (SAA-C03) exam is a certification that validates an individual's expertise in designing and deploying scalable, highly available, and fault-tolerant systems on the Amazon Web Services (AWS) platform. AWS Certified Solutions Architect - Associate certification is intended for professionals who have a solid understanding of AWS services and can design and implement solutions that meet business requirements. The SAA-C03 Exam measures the knowledge and skills necessary to design and deploy AWS services that are secure, cost-effective, and highly available.

>> Exam SAA-C03 Overview <<

Reliable SAA-C03 Test Forum, Reliable SAA-C03 Study Notes

Nowadays, having knowledge of the SAA-C03 study braindumps become widespread, if you grasp solid technological knowledge, you are sure to get a well-paid job and be promoted in a short time. According to our survey, those who have passed the exam with our SAA-C03 test guide convincingly demonstrate their abilities of high quality, raise their professional profile, expand their network and impress prospective employers. Most of them give us feedback that they have learned a lot from our SAA-C03 Exam Guide and think it has a lifelong benefit. They have more competitiveness among fellow workers and are easier to be appreciated by their boss.

Amazon SAA-C03 Exam is a rigorous test of candidates' knowledge and skills in AWS architecture and design. It requires a solid understanding of AWS services and features, as well as the ability to apply that knowledge to real-world scenarios. Candidates who pass the exam demonstrate their ability to design and deploy scalable, highly available, and fault-tolerant systems on AWS, making them highly valuable to employers looking to leverage AWS services.

Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q489-Q494):

NEW QUESTION # 489

A company hosts a three-tier ecommerce application on a fleet of Amazon EC2 instances. The instances run in an Auto Scaling group behind an Application Load Balancer (ALB). All ecommerce data is stored in an Amazon RDS for MySQL Multi-AZ DB instance. The company wants to optimize customer session management during transactions. The application must store session data

durably Which solutions will meet these requirements? (Select TWO)

- A. Use AWS Systems Manager Application Manager in the application to manage user session information
- **B. Deploy an Amazon ElastiCache for Redis cluster to store customer session information**
- C. Deploy an Amazon Cognito user pool to manage user session information
- **D. Turn on the sticky sessions feature (session affinity) on the ALB**
- E. Use an Amazon DynamoDB table to store customer session information

Answer: B,D

Explanation:

<https://aws.amazon.com/caching/session-management/>

NEW QUESTION # 490

[Design Secure Architectures]

A company runs an application in a VPC with public and private subnets. The VPC extends across multiple Availability Zones. The application runs on Amazon EC2 instances in private subnets. The application uses an Amazon Simple Queue Service (Amazon SQS) queue.

A solutions architect needs to design a secure solution to establish a connection between the EC2 instances and the SQS queue. Which solution will meet these requirements?

- **A. Implement an interface VPC endpoint for Amazon SQS. Configure the endpoint to use the private subnets. Add to the endpoint a security group that has an inbound access rule that allows traffic from the EC2 instances that are in the private subnets.**
- B. Implement an interface VPC endpoint for Amazon SQS. Configure the endpoint to use the public subnets. Attach to the interface endpoint a VPC endpoint policy that allows access from the EC2 instances that are in the private subnets.
- C. Implement a gateway endpoint for Amazon SQS. Add a NAT gateway to the private subnets. Attach an IAM role to the EC2 instances that allows access to the SQS queue.
- D. Implement an interface VPC endpoint for Amazon SQS. Configure the endpoint to use the public subnets. Attach an Amazon SQS access policy to the interface VPC endpoint that allows requests from only a specified VPC endpoint.

Answer: A

Explanation:

Understanding the Requirement: The application running on EC2 instances in private subnets needs to securely connect to an Amazon SQS queue without exposing traffic to the public internet.

Analysis of Options:

Interface VPC Endpoint in Private Subnets: Allows private, secure connectivity to SQS without using the public internet. Configuring security groups ensures controlled access from EC2 instances.

Interface VPC Endpoint in Public Subnets: Not necessary for private EC2 instances and exposes additional security risks.

Gateway Endpoint: Gateway endpoints are not supported for SQS; they are used for services like S3 and DynamoDB.

NAT Gateway with IAM Role: Increases costs and complexity compared to using an interface VPC endpoint directly.

Best Solution:

Interface VPC Endpoint in Private Subnets: This option ensures secure, private connectivity to SQS, meeting the requirement with minimal complexity and optimal security.

Amazon SQS and VPC Endpoints

NEW QUESTION # 491

An online gaming company is transitioning user data storage to Amazon DynamoDB to support the company's growing user base. The current architecture includes DynamoDB tables that contain user profiles, achievements, and in-game transactions.

The company needs to design a robust, continuously available, and resilient DynamoDB architecture to maintain a seamless gaming experience for users.

Which solution will meet these requirements MOST cost-effectively?

- A. Use DynamoDB Accelerator (DAX) to cache frequently accessed data. Deploy tables in a single AWS Region and enable auto scaling. Configure Cross-Region Replication manually to additional Regions.
- B. Create DynamoDB tables in multiple AWS Regions. Use on-demand capacity mode. Use DynamoDB Streams for Cross-

Region Replication between Regions.

- C. Create DynamoDB tables in a single AWS Region. Use on-demand capacity mode. Use global tables to replicate data across multiple Regions.
- D. Use DynamoDB global tables for automatic multi-Region replication. Deploy tables in multiple AWS Regions. Use provisioned capacity mode. Enable auto scaling.

Answer: D

Explanation:

DynamoDB Global Tables provide a fully managed, multi-region, and multi-master database solution that allows you to deploy DynamoDB tables in multiple AWS Regions. This ensures high availability and resiliency across different geographical locations, providing a seamless gaming experience for users.

Using provisioned capacity mode with auto-scaling ensures cost-efficiency by scaling up or down based on actual demand.

Option A: While on-demand capacity mode is flexible, provisioned capacity with auto-scaling is more cost-effective for predictable workloads.

Option B (DAX): DAX improves read performance, but it doesn't provide the multi-region replication needed for high availability and resiliency.

Option C: DynamoDB Streams with manual cross-region replication adds more complexity and operational overhead compared to Global Tables.

DynamoDB Global Tables

NEW QUESTION # 492

A Solutions Architect is managing a company's AWS account of approximately 300 IAM users. They have a new company policy that requires changing the associated permissions of all 100 IAM users that control the access to Amazon S3 buckets.

What will the Solutions Architect do to avoid the time-consuming task of applying the policy to each user?

- A. Create a new IAM group and then add the users that require access to the S3 bucket. Afterward, apply the policy to the IAM group.
- B. Create a new policy and apply it to multiple IAM users using a shell script.
- C. Create a new S3 bucket access policy with unlimited access for each IAM user.
- D. Create a new IAM role and add each user to the IAM role.

Answer: A

Explanation:

In this scenario, the best option is to group the set of users in an IAM Group and then apply a policy with the required access to the Amazon S3 bucket. This will enable you to easily add, remove, and manage the users instead of manually adding a policy to each and every 100 IAM users.

Creating a new policy and applying it to multiple IAM users using a shell script is incorrect because you need a new IAM Group for this scenario and not assign a policy to each user via a shell script. This method can save you time but afterward, it will be difficult to manage all 100 users that are not contained in an IAM Group.

Creating a new S3 bucket access policy with unlimited access for each IAM user is incorrect because you need a new IAM Group and the method is also time-consuming.

Creating a new IAM role and adding each user to the IAM role is incorrect because you need to use an IAM Group and not an IAM role.

Explanation:

NEW QUESTION # 493

A company hosts a multi-tier inventory reporting application on AWS.

The company needs a cost-effective solution to generate inventory reports on demand.

Admin users need to have the ability to generate new reports.

Reports take approximately 5-10 minutes to finish.

The application must send reports to the email address of the admin user who generates each report.

Options:

- A. Use Amazon Elastic Kubernetes Service (Amazon EKS) to host the report generation code. Use an Amazon API Gateway REST API to invoke the code. Use Amazon Simple Notification Service (Amazon SNS) to send the reports to admin users.
- B. Use Amazon EventBridge to invoke a scheduled AWS Lambda function to generate the reports. Use Amazon Simple

Notification Service (Amazon SNS) to send the reports to admin users.

- C. Use Amazon Elastic Container Service (Amazon ECS) to host the report generation code. Use an Amazon API Gateway HTTP API to invoke the code. Use Amazon Simple Email Service (Amazon SES) to send the reports to admin users.
- **D. Create an AWS Lambda function to generate the reports. Use a function URL to invoke the function. Use Amazon Simple Email Service (Amazon SES) to send the reports to admin users.**

Answer: D

Explanation:

Detailed

- A). ECS + API Gateway: Overly complex and costly for an on-demand, intermittent workload.
- B). EventBridge + SNS: EventBridge schedules are unnecessary for on-demand generation.
- C). EKS + API Gateway: Overkill for this use case, with high operational overhead.
- D). Lambda + SES: Most cost-effective and efficient solution for generating and emailing reports on demand.
