SAP Certified Associate - SAP Business Data Cloud Sample Questions (Q25-Q30):

NEW QUESTION # 25

Which SAP Analytics Cloud feature uses natural language processing?

- A. Just Ask feature
- B. Data analyzer
- C. Digital boardroom
- D. Smart insight

Answer: A

Explanation:

The "Just Ask" feature in SAP Analytics Cloud (SAC) is a prime example of its integration with natural language processing (NLP). This innovative AI-powered capability allows users to interact with their data by simply typing questions in plain, everyday language, rather than needing to navigate complex menus or understand underlying data structures. For instance, a user might type "Show me sales by region for the last quarter," and "Just Ask" will interpret this query, identify relevant dimensions and measures, and automatically generate an appropriate visualization or insight. This significantly democratizes data analysis, making it accessible to a wider audience, including business users who may not have extensive technical skills. By leveraging NLP, "Just Ask" bridges the gap between human language and data queries, transforming how users discover and consume insights within SAC, ultimately accelerating decision-making.

NEW QUESTION # 29

Why would you choose the "Validate Remote Tables" feature in the SAP Datasphere repository explorer?

- A. To test if data has been replicated completely
- B. To preview data of remote tables
- **C. To identify structure updates of the remote sources**
- D. To detect if remote tables are defined that are not used in Views

Answer: C

Explanation:

The "Validate Remote Tables" feature in the SAP Datasphere repository explorer is primarily used to identify structure updates of the remote sources. When a remote table is created in Datasphere, it establishes a metadata connection to a table or view in an external source system. Over time, the structure of the source object (e.g., column additions, deletions, data type changes) might change. The "Validate Remote Tables" function allows you to compare the metadata currently stored in Datasphere for the remote table with the actual, current metadata in the source system. If discrepancies are found, Datasphere can highlight these structural changes, prompting you to update the remote table's definition within Datasphere to match the source. This ensures that views and data flows built on these remote tables continue to function correctly and align with the underlying source structure, preventing data access issues or incorrect data interpretations.
