Salesforce Certified Development Lifecycle and Deployment Architect certification is ideal for professionals who are responsible for managing Salesforce development projects, including architects, developers, project managers, and technical leaders.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q98-Q103):

NEW QUESTION # 98

Universal Containers has just initiated a project to implement partner community. The application will be deployed into a production environment currently in use by a large Salesforce user base. The project manager has insisted that the development and testing team use a single developer sandbox. What is the risk with this approach?

- A. Testers will experience functional changes throughout testing due to not having isolation from development.
- B. Testers will hit governor limits due to large volume of users in the developer sandbox.
- C. Tester will encounter platform limits due to developer sandbox capacity limits.
- D. Refreshing the developer sandbox will take significant time.

Answer: A

Explanation:

Explanation

Testers will experience functional changes throughout testing due to not having isolation from development.

Using a single developer sandbox for both development and testing is not a good practice, as it does not provide a stable and consistent environment for testing. The developers may make changes to the code or configuration that affect the functionality or behavior of the application, which may cause the testers to encounter unexpected results or errors.

NEW QUESTION # 99

Universal Containers' developers are working on a Visualforce page in a sandbox when an administrator adds a new field to Production. Which two approaches could an architect suggest to an administrator that would assist the developers in their development process? Choose 2 answers

- A. Manually replicate the same changes in the developer sandbox to ensure that changes made in production are reflected in the sandbox that the developers are working on
- B. Use Salesforce-to-Salesforce to deploy the changes from Production to the sandbox, to ensure that changes made in production are reflected in the sandbox that the developers are working on
- C. Use a Change Set to deploy the changes from Production to the sandbox, to ensure that changes made in production are reflected in the sandbox that the developers are working on
- D. Refresh the developer sandbox to ensure that changes made in production are reflected in the sandbox that the developers are working on

Answer: A,C

Explanation:

Using a Change Set or manually replicating the changes in the developer sandbox are both valid approaches to ensure that changes made in production are reflected in the sandbox that the developers are working on.

Refreshing the developer sandbox would overwrite any changes made by the developers, and Salesforce-to-Salesforce is not a deployment tool.

NEW QUESTION # 100

Universal Containers has multiple project teams integrating Salesforce to various systems. Integration Architects are complaining about the various integration patterns used by the teams and lack a common understanding of the integration landscape. What should architect recommended to address the challenges?

- A. Recommend a fire-and-forget design pattern to be used for all teams.
- B. Implement a data governance policy and publish the documentation to all teams.
- C. Create design standards focused on integration and provide training to all teams
- D. Recommend an outbound message design pattern to be used for all teams.

Answer: C

Explanation:

Creating design standards focused on integration and providing training to all teams is the best way to address the challenges of having various integration patterns and a lack of common understanding of the integration landscape. Design standards can help to

establish consistent and best practices for integrating Salesforce with other systems, such as choosing the appropriate integration style, pattern, tool, and protocol. Training can help to educate and align the teams on the design standards and the integration architecture.

NEW QUESTION # 101

Universal Containers has written several validation rules and workflow rules for the lead object. Which two test types should an Architect suggest to ensure that a large inbound call center does not experience platform slowdowns under high call volume for the Lead object? Choose 2 answers

- A. Load Test
- B. Performance Test
- C. Stress Test
- D. Unit Test

Answer: A,B

Explanation:

Explanation

C and D are the correct answers, as Load Test and Performance Test are the test types that should be suggested to ensure that a large inbound call center does not experience platform slowdowns under high call volume for the Lead object. A load test is a test that measures the performance and behavior of the system under a specific load, such as a large number of concurrent users or requests. A performance test is a test that measures the speed, responsiveness, and stability of the system under various conditions, such as different configurations or environments. These tests can help to identify and prevent any potential issues or bottlenecks that could affect the user experience or the system functionality. A is incorrect, as Unit Test is not a test type that should be suggested for this scenario, as it is a test that verifies the functionality and logic of a single unit of code, such as a method or a class, but not the performance or behavior of the system as a whole. B is incorrect, as Stress Test is not a test type that should be suggested for this scenario, as it is a test that measures the performance and behavior of the system under extreme or abnormal conditions, such as exceeding the capacity or resources of the system, but not the performance or behavior of the system under normal or expected conditions. You can learn more about these tests in the Testing Strategies module on Trailhead.

NEW QUESTION # 102

Universal Containers (UC) is planning for a huge data migration from a home-grown on-premise system to Salesforce as part of their Service Cloud Implementation. UC has approximately 5 million customers, 10 million contacts, and 30 million active cases. Which are the three key areas that should be tested as part of Data Migration? Choose 3 answers

- A. Case association with correct contact and Account.
- B. Data transformation against the source system.
- C. Case assignment rules and escalation rules.
- D. Case Ownership along with associated entitlement and milestones.
- E. Page Layout assignment to the profiles

Answer: A,B,D

Explanation:

Explanation

These are the correct answers because they are related to the data quality and integrity of the migrated data.

Case association, case ownership, and data transformation are all important aspects of data migration that should be tested. Case assignment rules and escalation rules are not directly related to data migration, but rather to the business logic and workflow of the application. Page layout assignment is also not related to data migration, but rather to the user interface and security of the application.

NEW QUESTION # 103

.....

An individual can't have a significant understanding of the subject of the Salesforce Certified Development Lifecycle and Deployment Architect certification in any event, going before scrutinizing accessible. They don't know anything about how to make sense of the center thoughts, which is a test in the event that they need to approach the subtleties to others concerning the Salesforce Certified

Development Lifecycle and Deployment Architect (Development-Lifecycle-and-Deployment-Architect) exam. Thusly, more keen to take help from specialists who have some involvement in the Salesforce Certified Development Lifecycle and Deployment Architect (Development-Lifecycle-and-Deployment-Architect) exam. Salesforce Development-Lifecycle-and-Deployment-Architect Certification Exam concentrate on material which incorporates a rundown of the multitude of points and an outline making sense of the general subject.
