## Top Features of PrepAwayETE Esri EAEP2201 Exam Questions

The EAEP2201 web-based practice exam requires no installation so you can start your preparation instantly right after you purchase. With thousands of satisfied customers around the globe, questions of the Enterprise Administration Professional 2201 (EAEP2201) exam dumps are real so you can pass the Enterprise Administration Professional 2201 (EAEP2201) certification on the very first attempt. Hence, it reduces your chances of failure and you can save money and time as well. Esri exam questions come in three formats i.e., web-based practice test, desktop practice test software, and PDF dumps.

Esri EAEP2201 exam is a certification exam that tests the knowledge and skills of professionals who administer and manage enterprise-level GIS systems. It is designed for individuals who have a thorough understanding of Esri's ArcGIS platform and are responsible for the deployment, configuration, and maintenance of GIS infrastructure. EAEP2201 exam is a comprehensive assessment of an individual's knowledge in areas such as enterprise system architecture, security, database management, and performance optimization.

Esri EAEP2201 Exam covers a wide range of topics related to ArcGIS Enterprise administration. These topics include installation

and configuration, security and authentication, high availability and disaster recovery, and performance tuning. Candidates are expected to have hands-on experience with ArcGIS Enterprise and be familiar with its architecture and components. EAEP2201 exam consists of multiple-choice questions and practical scenarios that test a candidate's ability to solve real-world problems.

## Esri Enterprise Administration Professional 2201 Sample Questions (Q56-Q61):

### NEW QUESTION # 56

A client has an internet-accessible ArcGIS Enterprise deployment with the Web Adaptors in the DMZ, and the remaining components are on an internal network behind a firewall. A user on the internet must access a web map in that environment. Which ports must be open in the firewall between the DMZ and the internal network?

- A. 6443 and 7443
- B. 2443 and 6443
- C. 443 and 6443
- D. 80 and 443

**Answer: A**

Explanation:

Web Adaptors in the DMZ must forward requests to internal components (Portal and Server). These internal services operate over HTTPS via ports:

\* 7443 for Portal for ArcGIS

\* 6443 for ArcGIS Server

Therefore, the firewall must allow traffic over ports 6443 and 7443 from the Web Adaptors (DMZ) to the respective internal services.

From ArcGIS Enterprise security documentation:

"When using Web Adaptors in the DMZ, make sure ports 6443 and 7443 are open between the Web Adaptors and the internal ArcGIS Server and Portal components respectively."

\* Option B is partially correct but leaves out Portal (7443).

\* Option C is for HTTP/HTTPS access from the public, not internal communications.

\* Option D includes the Data Store admin port (2443), which isn't required here.

Reference: ArcGIS Enterprise - Firewalls, Ports, and DMZ Configuration

### NEW QUESTION # 57

Users are reporting service timeouts and performance issues. The administrator notices that only the minimum number of instances are running during performance spikes. They want to monitor usage trends before adjusting instance settings.

Which action should the administrator perform?

- A. Change the log level to Debug in ArcGIS Server Manager
- B. Enable Windows Performance Monitor
- C. Monitor Task Manager on each ArcGIS Server machine
- D. Create a report of server statistics in ArcGIS Server Manager

**Answer: D**

Explanation:

To monitor usage patterns, including the number of requests and instances in use, ArcGIS Server provides statistics reports in Server Manager. These reports show peak and average service usage, helping administrators decide how to scale service instance counts.

From ArcGIS Server documentation:

"Use the ArcGIS Server Manager statistics reporting tool to monitor service usage trends over time. This data helps inform adjustments to instance counts."

\* Option A gives only raw system metrics, not service-specific insights.

\* Option B (Debug logs) causes overhead and isn't appropriate for monitoring trends.

Reference: ArcGIS Server - Monitoring and Reporting Service Usage Statistics

### NEW QUESTION # 58

A user must create groups, edit features, and create web apps. This user will also create print layouts, charts, and animations using

ArcGIS Pro. The organization has no additional add-on licenses.  
Which user type should be configured for this user?

- A. Editor
- **B. GIS Professional**
- C. Creator

**Answer: B**

Explanation:

The GIS Professional user type includes access to ArcGIS Pro, which is required for creating print layouts, charts, animations, and conducting advanced analysis. It also includes capabilities such as creating groups, editing features, and creating web apps within the ArcGIS Enterprise portal without needing additional add-on licenses.

The Creator user type supports most web GIS tasks but does not include ArcGIS Pro unless an add-on license is assigned.

The Editor user type is the most limited and is intended for editing existing content only, not for creating or managing groups or web applications.

Reference Source: ArcGIS Enterprise documentation - User types, capabilities, and included applications

#### NEW QUESTION # 59

An organization experiences a temporary loss of service for its ArcGIS Enterprise deployment due to expired licenses.  
What should the administrator have done to prevent this issue?

- **A. Configure the ArcGIS Enterprise portal to send an automated email when the portal license is expiring**
- B. Use the license file in read-only mode to extend the license
- C. Create a Python script to run an administrative report and schedule the script to run regularly
- D. Design an information banner to automatically display the license expiration date

**Answer: A**

#### NEW QUESTION # 60

A GIS administrator is publishing a feature service. All 2,400 features in the dataset must be able to be returned from a single request to the service.

Which action should the administrator perform?

- A. Enable cached drawing mode
- **B. Increase the max record count**
- C. Adjust pooling to handle the request
- D. Use service defaults for publishing

**Answer: B**

Explanation:

By default, feature services limit the number of records returned in a single request (usually set to 1,000).

To allow all 2,400 features to be returned in one call, the administrator needs to increase the "Maximum number of records returned by the server" (maxRecordCount) setting during or after publishing.

From the ArcGIS Server documentation:

"The maxRecordCount property defines the number of records returned by the server in a single request. To return all features, this value must be increased accordingly."

\* Option A (adjust pooling) relates to concurrency and scalability, not data retrieval limits.

\* Option C would keep the default setting of 1,000, which would not meet the requirement.

\* Option D relates to visual performance, not record retrieval.
