EMC Dell Technologies PowerMax Operate Sample Questions (Q147-Q152):

NEW QUESTION # 147

SRDF/A has been enabled between two VMAX3 arrays. What will the RDF pair state be if there is a permanent loss of all RDF links?

- A. Split
- B. Suspended
- C. Partitioned
- D. Consistent

Answer: C

NEW QUESTION # 148

What input is required when registering an ESXi server in Unisphere for PowerMax?

- A. Unisphere credentials and hostname
- B. ESXi server credentials and Unisphere credentials
- C. IP address and hostname
- C IP address and ESXi server credentials

Answer: B

Explanation:

Step by Step Comprehensive Detailed Explanation:

To register an ESXi server in Unisphere for PowerMax, you need to provide the following information:

* IP Address: The IP address of the ESXi server that you want to manage. This allows Unisphere to communicate with the ESXi host.

* ESXi Server Credentials: The username and password of an account with sufficient privileges to access and manage the ESXi server. This ensures that Unisphere has the necessary permissions to perform storage-related operations on the ESXi host.

Why other options are incorrect:

* A. Unisphere credentials and hostname: Unisphere credentials are used to log in to Unisphere itself, not to register an ESXi server.

* B. IP address and hostname: While the hostname might be helpful, the ESXi server credentials are essential for authentication and authorization.

* D. ESXi server credentials and Unisphere credentials: Unisphere credentials are not required for registering an ESXi server.

* Dell PowerMax and VMware vSphere Configuration Guide: This guide provides detailed instructions on how to register and manage ESXi servers in Unisphere for PowerMax. You can find this document on the Dell Support website by searching for "PowerMax and VMware vSphere Configuration Guide."

* Dell Unisphere for PowerMax 10.0.0 Online Help: The online help for Unisphere might also provide guidance on registering ESXi servers.

NEW QUESTION # 149

A PowerMax 8000 was initially ordered as a multi-engine system. How does this system differ from a PowerMax 8000 that was initially ordered as a single-engine even if it is upgraded to a multi-engine system at a later time?

- A. Each director has twice the backend connectivity
- B. Each director has one more NVMe Flash module
- C. Each director has one more Universal FE slot
- D. Each director has the compression/deduplication module in Slot 9

Answer: C

NEW QUESTION # 150

A TimeFinder SnapVX snapshot of a Storage Group was created with a time-to-live setting of seven days. Fourteen days after snapshot creation, a query shows that the snapshot still exists. What is a possible reason for this issue?

- A. Snapshot was created in NoCopy mode
- B. Snapshot has one or more linked targets
- C. Snapshot was not manually terminated
- D. Reserved Capacity limit was exceeded

Answer: B

Explanation:

Step by Step Comprehensive Detailed Explanation:

TimeFinder SnapVX snapshots in PowerMax can be configured with a time-to-live (TTL) setting. This setting automatically deletes the snapshot after the specified time period has elapsed. However, there are certain situations where a snapshot might persist beyond its TTL:

* **Linked Targets:** If a snapshot has one or more linked targets associated with it, the snapshot will not be automatically deleted even if the TTL expires. This is because the linked targets depend on the snapshot for their data. The snapshot will remain available until all linked targets are deleted or unlinked.

Why other options are incorrect:

* **B. Snapshot was not manually terminated:** The TTL setting is designed to automatically delete the snapshot; manual termination is not required.

* **C. Snapshot was created in NoCopy mode:** The NoCopy mode affects how the snapshot is initially created, not its TTL behavior.

* **D. Reserved Capacity limit was exceeded:** The Reserved Capacity limit applies to the overall storage space used by snapshots, not the TTL of individual snapshots.
