We provide the dumps in the format for your exam. This questions dumps format is fairly easy and it is suitable for smart devices. These actual questions and answers can easily be downloaded on the PC, tablet, laptop or mobile and you can prepare Exam at your own convenience. When you have the exam dumps on your preferred device, then you are at ease of preparing for the exam at your own will.

You can use the latest and up-to-date real questions and answers for the Exam. If you want to have the understanding of different topics, then you need to use the best available practice dumps and this can help you in getting the Exam cleared with ease. These dumps always keep the exam syllabus up to date and that is the reason all the actual questions and answers are up to date to give worry-free exam preparation to the candidates.

Exam dumps professionals are fully aware of the fact that the syllabus for Exam need to be up to date. Updates for 90 days are provided to the candidate to allow the candidate to prepare exam from the up-to-date dumps. Up-to-dumps let the candidates have the best preparation and get successfully through the Exam. You can download these dumps from our website at any time you want. If you are satisfied with our service, then don't hesitate to make a purchase by clicking on the link given above this paragraph. You can download this dump directly from our site and start practicing for your exam. You will get a dump file that contains questions with answers along with explanations for those questions. Do not waste your time looking for other websites where that charge money for their downloads or even worse sell their study material online! It is the best choice for you if you are looking for preparation material to pass the exam. All you need is an internet connection and an efficient digital device.

Our FSCP study materials can help you pass test faster. You can take advantage of the certification. Many people improve their ability to perform more efficiently in their daily work with the help of our FSCP exam questions and you can be as good as they are. The moment you choose to go with our FSCP Study Materials, your dream will be more clearly presented to you. Next, through my introduction, I hope you can have a deeper understanding of our FSCP learning quiz. We really hope that our FSCP study materials will give you the help to pass the exam.

You can take advantage of several perks if you buy TorrentExam's bundle package of Fore Scout FSCP dumps. The bundle package is cost-effective and includes all three formats of Fore Scout Certified Professional Exam exam preparation material Fore Scout FSCP PDF Dumps Questions Answers, and Fore Scout FSCP Practice Test software (online and offline). Fore Scout FSCP Dumps are worth trying while preparing for the exam. You will be sure of what Fore Scout FSCP exam questions will be asked in the exam.

Forescout Certified Professional Exam Sample Questions (Q39-Q44):

NEW QUESTION # 39

What is the automated safety feature to prevent network wide outages/blocks?

- A. Disable policy
- **B. Action Thresholds**
- C. Stop all policies
- D. Send an Email Alert
- E. Disable Policy Action

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

Action Thresholds is the automated safety feature designed to prevent network-wide outages and blocks.

According to the Forescout Platform Administration Guide, Action Thresholds are specifically designed to automatically implement safeguards when rolling out sanctions (blocking actions) across your network.

Purpose of Action Thresholds:

Action thresholds work as an automated circuit breaker mechanism that prevents catastrophic network-wide outages. The feature establishes maximum percentage limits for specific action types on a single appliance.

When these limits are reached, the policy automatically stops executing further blocking actions to prevent mass network disruption.

How Action Thresholds Prevent Outages:

Consider a scenario where a policy is misconfigured and would block 90% of all endpoints on the network due to a false condition match. Without Action Thresholds, this could cause a network-wide outage. With Action Thresholds configured:

* Limit Definition - An administrator sets an action threshold (e.g., 20% of endpoints can be blocked by Switch action type)

* Automatic Enforcement - When this percentage threshold is reached, the policy automatically stops executing the blocking action for any additional endpoints

* Alert Generation - The system generates alerts to notify administrators when a threshold has been reached

* Protection - This prevents the policy from cascading failures that could affect the entire network

Action Threshold Configuration:
Each action type (e.g., Switch blocking, Port blocking, External port blocking) can be configured with its own threshold percentage. This allows granular control over the maximum impact any single policy can have on the network.

Why Other Options Are Incorrect:

* A. Stop all policies - This is a manual intervention, not an automated safety feature; also, it's too drastic and would disable legitimate policies

* B. Disable policy - This is a manual action, not an automated safety mechanism

* C. Disable Policy Action - While you can disable individual actions, this is not an automated threshold-based safeguard

* E. Send an Email Alert - Alerts notify administrators but do not automatically prevent outages; they require manual intervention

NEW QUESTION # 40

Which setting is NOT available when initially adding a server to the User Directory Plugin?

- A. Domain Aliases
- **B. Replica**
- C. Test
- D. Advanced
- E. Domain

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

According to the Forescout User Directory Plugin Configuration Guide and supported integration documentation, Replica is NOT available when initially adding a server to the User Directory Plugin.

Replicas are configured after the initial server setup is complete.

User Directory Server Initial Setup Process:

When initially adding a User Directory server, the following settings are available:

- * Server Name - The name to identify the server in Forescout
- * Address - The IP address or FQDN of the User Directory server
- * Port - The port number (typically 389 for LDAP, 636 for secure LDAP)
- * Domain - The domain name associated with the User Directory
- * Test - Option to test the connection and credentials
- * Advanced - Advanced configuration options

Replica Configuration - Post-Initial Setup:

According to the documentation:

"After configuring server settings, you can configure server tests and replicas." The Replica settings are NOT available during the initial server addition. Instead, replicas are configured as a separate step after the primary server configuration is complete.

Replica Setup Workflow:

According to the User Directory Plugin configuration process:

- * Step 1: Add Server - Configure the primary server with Name, Address, Port, Domain
- * Step 2: Test Connection - Use the Test option to verify connectivity
- * Step 3: Configure Replicas - After the primary server is fully configured, then add replica servers. The documentation explicitly states:

"Refer to the following sections for server configuration details. After configuring server settings, you can configure server tests and replicas." Why Other Options Are Available Initially:

- * A. Test -#Available initially; allows testing of server credentials and connectivity before completion
- * B. Domain -#Available initially; domain name is required during server setup
- * C. Domain Aliases -#Available initially; additional domain aliases can be specified for the server
- * D. Advanced -#Available initially; advanced options like authentication types, TLS, etc. are available during setup

Purpose:

Replicas are used to provide redundancy and failover capability. According to the documentation:

When replica servers are configured:

- * If the primary User Directory server becomes unavailable, the Forescout platform can failover to a replica server
- * Multiple replicas can be specified for increased fault tolerance

NEW QUESTION # 41

Which of the following is true regarding how CounterACT restores a quarantined endpoint to its original production VLAN after the "Assign to VLAN Action" is removed?

- A. This happens automatically because CounterACT compares the running and startup configs
- B. A policy is required to ensure this happens correctly.
- C. This happens automatically as long as no configuration changes to the switch are made to the running config
- **D. This happens automatically as long as configuration changes to the switchport access VLAN of affected ports are not saved in the startup config**
- E. This happens automatically as long as configuration changes to the switchport access VLAN of affected ports are not changed in the switch running config

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

According to the Forescout Switch Plugin Configuration Guide Version 8.12 and 8.14.2, CounterACT restores a quarantined endpoint to its original production VLAN automatically as long as configuration changes to the switchport access VLAN of affected ports are not saved in the startup config.

VLAN Restoration Mechanism:

According to the Switch Plugin documentation:

When the "Assign to VLAN" action is removed or expires, CounterACT can restore the original VLAN configuration by comparing the running configuration with the startup configuration on the switch.

The Key Requirement:

According to the documentation:

The restoration process works as follows:

- * Assign to VLAN Action Applied - Endpoint is moved to quarantine VLAN (switch running config is updated)
- * Assign to VLAN Action Removed - CounterACT wants to restore the original VLAN
- * Running vs. Startup Config Comparison - CounterACT compares running config to startup config
- * Restoration - The port is returned to its original VLAN as defined in the startup configuration Critical Condition:

According to the documentation:

"This happens automatically as long as configuration changes to the switchport access VLAN of affected ports are not saved in the startup config" This is critical because:

- * If manual changes are saved to the startup config, CounterACT cannot determine what the "original" VLAN should be
- * The startup config must remain unchanged for CounterACT to restore the correct VLAN
- * The running config changes are temporary and revert to startup config values Why Other Options Are Incorrect:
- * A. CounterACT compares the running and startup configs - While true that comparison occurs, the condition is about whether changes are saved to startup, not just comparing
- * B. Configuration changes...are not changed in the switch running config - Too broad; there can be other running config changes; the specific requirement is about VLAN configuration being saved to startup
- * C. No configuration changes to the switch are made to the running config - Too strict; other changes can be made; only VLAN switchport access configuration matters
- * E. A policy is required - Incorrect; this is automatic behavior, not policy-dependent Default VLAN Feature:

According to the Switch Plugin Configuration Guide:

The Default VLAN feature ensures that ports are automatically assigned to a default VLAN unless specifically configured otherwise. When the "Assign to VLAN" action is removed, the port returns to the default VLAN (as defined in the startup configuration).

NEW QUESTION # 42

Which of the following best describes why PXE boot endpoints should be exempt from Assessment policies?

- A. Because they will never be manageable or have the required software and services
- B. They have already been deployed and should immediately be subject to Assessment policies
- **C. Because they are not yet manageable and may not have all the required software and services installed**
- D. Because they are special endpoints playing a specific role in the network
- E. Because they will not be subject to the Acceptable Use Policy

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

PXE (Preboot Execution Environment) boot endpoints should be exempt from Assessment policies because they are not yet manageable and may not have all the required software and services installed. According to the Forescout Administration Guide, endpoints in the early stages of deployment, such as those booting via PXE, are temporary in nature and lack the necessary management capabilities and required software components.

PXE Boot Endpoints Characteristics:

PXE boot endpoints represent machines in a temporary state during the deployment process:

- * Not Yet Fully Deployed - PXE boot is used during initial OS installation and deployment
- * Lack Required Services - The endpoint does not yet have installed:
- * SecureConnector (if required for management)
- * Endpoint agents
- * Required security software
- * Management services
- * Limited Configuration - The endpoint may not have completed network configuration
- * Temporary State - PXE boot endpoints are in a transient state, not their final operational state

Policy Endpoint Exceptions: According to the documentation, administrators can "select endpoints in the Detections pane and exempt them from further inspection for the policy that detected them". This is particularly important for PXE boot endpoints because:

- * False Positives - Assessment policies might flag PXE boot endpoints as non-compliant due to missing software that hasn't been installed yet
 - * Blocked Deployment - If blocking actions are applied, they could interfere with the deployment process
 - * Temporary Assessment - Once the endpoint is fully deployed and manageable, it can be added back to Assessment policies
 - * Operational Efficiency - Exempting PXE boot endpoints prevents unnecessary policy violations during the deployment window
- Manageable vs. Unmanageable Endpoints:

According to the documentation:

"Endpoints are generally unmanageable if their remote registry and file system cannot be accessed by Forescout. Unmanageable hosts can be included in your policy." PXE boot endpoints specifically fall into this category because:

- * Remote management is not yet available
- * Required agents are not installed
- * File system access is not established

Why Other Options Are Incorrect:

- * A. Because they will not be subject to the Acceptable Use Policy - Not the primary reason; Assessment policies differ from Acceptable Use policies
- * B. They have already been deployed and should immediately be subject to Assessment policies - Contradicts the purpose; PXE boot endpoints are NOT yet deployed
- * D. Because they will never be manageable or have the required software and services - Incorrect; once deployed, they WILL become manageable
- * E. Because they are special endpoints playing a specific role in the network - While true in context, this doesn't explain why they need exemption

- * Restricting Endpoint Inspection documentation

NEW QUESTION # 43

Policies will recheck when certain conditions are met. These may include...

- A. Policy categorization, admission event, action schedule activation
- **B. Policy recheck timer expires, admission event, SC event change**
- C. Admission event, group name change, Scope recheck timer expires
- D. Admission event, policy categorization, SC event change
- E. Policy recheck timer expires, group name change, SC event change

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

According to the Forescout Administration Guide, policies recheck when the following conditions are met: Policy recheck timer expires, admission event, or SC event change.

Policy Recheck Conditions:

According to the Main Rule Advanced Options documentation:

"By default, both matched endpoints and unmatched endpoints are rechecked every eight hours, and on any admission event."

Additionally, according to the documentation:

"You can also configure several recheck settings to work simultaneously. For example, when a host IP address changes every five hours, recheck settings can be configured for:

- * Policy recheck timer expires - Default 8 hours
- * Admission events - Triggers like DHCP request, IP address change
- * SC (SecureConnector) event change - When SecureConnector status changes"

Three Main Policy Recheck Triggers:

According to the documentation:

- * Policy Recheck Timer Expires
- * Default: Every 8 hours
- * Can be customized (1 hour to infinite)
- * Applies to all endpoints matching or not matching the policy
- * Admission Event
- * DHCP Request
- * IP Address Change
- * Switch Port Change
- * Authentication event
- * VPN user connection
- * Immediate recheck when triggered
- * SC Event Change
- * SecureConnector deployed or removed
- * SecureConnector status changes (online/offline)
- * SecureConnector version changes

Why Other Options Are Incorrect:

- * A. Admission event, group name change, Scope recheck timer expires - Group name change is NOT a recheck trigger
 - * C. Admission event, policy categorization, SC event change - Policy categorization is NOT a recheck trigger
 - * D. Policy categorization, admission event, action schedule activation - Neither policy categorization nor action schedule activation triggers rechecks
 - * E. Policy recheck timer expires, group name change, SC event change - Group name change does NOT trigger policy rechecks
- Recheck Configuration:

According to the documentation:

"You can configure under what conditions to perform a recheck. By default, endpoints are rechecked every eight hours, and on any admission event. To define the recheck policy, you can configure:

- * Custom recheck interval (instead of 8 hours)
- * Which admission events trigger rechecks
- * Whether SecureConnector events trigger rechecks"

- * Forescout eyeSight policy main rule advanced options
