

Pass Guaranteed Quiz 2025 Python Institute PCEP-30-02: PCEP - Certified Entry-Level Python Programmer Pass-Sure Latest Test Labs

DOWNLOAD the newest ValidVCE PCEP-30-02 PDF dumps from Cloud Storage for free: https://drive.google.com/open?id=1bFJnmy9aSAS_khzAwEE7JTZJi2-SWtrUi

Do some fresh things each day that moves you out of your comfort zone. If you stay cozy every day, you will gradually become lazy. Now, you have the opportunity to change your current conditions. Our PCEP-30-02 real exam dumps are specially prepared for you. Try our PCEP-30-02 study tool and absorb new knowledge. After a period of learning, you will find that you are making progress. The knowledge you have studied on our PCEP-30-02 Exam Question will enrich your life and make you wise. Do not reject challenging yourself. Your life will finally benefit from your positive changes. Let us struggle together and become better. Then you will do not need to admire others' life. Our PCEP-30-02 real exam dumps will fully change your life.

In order to meet different needs of our customers, we offer you three versions of PCEP-30-02 study materials for you. Each version has its own advantages, and you can choose the most suitable one according to your own needs. PCEP-30-02 PDF version is printable, and if you like paper one, you can choose this version. PCEP-30-02 soft test engine can stimulate the real exam environment, and you can build your confidence if you choose this version. PCEP-30-02 Online test engine can practice offline and can record the training process, if you have the needs like this, you can choose this version.

Newest Python Institute PCEP-30-02 Practice Questions in PDF Format for Quick Preparation

Are you still feeling distressed for expensive learning materials? Are you still struggling with complicated and difficult explanations in

textbooks? Do you still hesitate in numerous tutorial materials? PCEP-30-02 study guide can help you to solve all these questions. PCEP-30-02 certification training is compiled by many experts over many years according to the examination outline of the calendar year and industry trends. PCEP-30-02 Study Guide not only apply to students, but also apply to office workers; not only apply to veterans in the workplace, but also apply to newly recruited newcomers. PCEP-30-02 guide torrent uses a very simple and understandable language, to ensure that all people can read and understand.

Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q32-Q37):

NEW QUESTION # 32

Insert the code boxes in the correct positions in order to build a line of code which asks the user for an integer value and assigns it to the depth variable.

(Note: some code boxes will not be used.)

input()
)
"Enter immersion depth:"
==
int()
-
float()

PYTHON INSTITUTE
Open Education & Development Group

Answer:

Explanation:

input()
)
"Enter immersion depth:"
==
int()
-
float()

depth == int(input("Enter immersion depth: "))

PYTHON INSTITUTE
Open Education & Development Group

Explanation:

PYTHON INSTITUTE
Open Education & Development Group

depth = int(input("Enter immersion depth: "))

One possible way to insert the code boxes in the correct positions in order to build a line of code which asks the user for an integer value and assigns it to the depth variable is:

```
depth = int(input("Enter the immersion depth: "))
```

This line of code uses the input function to prompt the user for a string value, and then uses the int function to convert that string value

into an integer number. The result is then assigned to the variable depth.

You can find more information about the input and int functions in Python in the following references:

* [Python input() Function]

* [Python int() Function]

NEW QUESTION # 33

What happens when the user runs the following code?

```
total = 0
for i in range(4):
    if 2 * i == 0:
        total += 1
    else:
        total += 1
print(total)
```

The image shows a Python code snippet with a watermark 'validvce.com' and a 'PYTHON INSTITUTE' logo. The code initializes 'total' to 0, loops from 0 to 3, and increments 'total' by 1 for each iteration, regardless of whether 'i' is even or odd. This results in 'total' being 4 after the loop.

- A. The code outputs 1.
- B. The code enters an infinite loop.
- C. The code outputs 3.
- D. The code outputs 2.

Answer: D

Explanation:

Explanation

The code snippet that you have sent is calculating the value of a variable "total" based on the values in the range of 0 to 3. The code is as follows:

total = 0 for i in range(0, 3): if i % 2 == 0: total = total + 1 else: total = total + 2 print(total) The code starts with assigning the value 0 to the variable "total". Then, it enters a for loop that iterates over the values 0, 1, and 2 (the range function excludes the upper bound). Inside the loop, the code checks if the current value of "i" is even or odd using the modulo operator (%). If "i" is even, the code adds 1 to the value of "total". If "i" is odd, the code adds 2 to the value of "total". The loop ends when "i" reaches 3, and the code prints the final value of "total" to the screen.

The code outputs 2 to the screen, because the value of "total" changes as follows:

When i = 0, total = 0 + 1 = 1

When i = 1, total = 1 + 2 = 3

When i = 2, total = 3 + 1 = 4

When i = 3, the loop ends and total = 4 is printed

Therefore, the correct answer is B. The code outputs 2.

NEW QUESTION # 34

What is the expected result of the following code?

PYTHON
INSTITUTE
Open Education & Development Group

```
def velocity(x=10):
    return speed + x
```

```
speed = 10
new_speed = velocity()
new_speed = velocity(new_speed)
print(new_speed)
```

- A. 0
- B. 1
- C. The code is erroneous and cannot be run.
- D. 2

Answer: C

Explanation:

Explanation

The code snippet that you have sent is trying to use the global keyword to access and modify a global variable inside a function. The code is as follows:

speed = 10
def velocity():
 global speed
 speed = speed + 10
 return speed
print(velocity())

The code starts with creating a global variable called "speed" and assigning it the value 10. A global variable is a variable that is defined outside any function and can be accessed by any part of the code. Then, the code defines a function called "velocity" that takes no parameters and returns the value of "speed" after adding 10 to it. Inside the function, the code uses the global keyword to declare that it wants to use the global variable

"speed", not a local one. A local variable is a variable that is defined inside a function and can only be accessed by that function. The global keyword allows the function to modify the global variable, not just read it. Then, the code adds 10 to the value of "speed" and returns it. Finally, the code calls the function "velocity" and prints the result.

However, the code has a problem. The problem is that the code uses the global keyword inside the function, but not outside. The global keyword is only needed when you want to modify a global variable inside a function, not when you want to create or access it outside a function. If you use the global keyword outside a function, you will get a SyntaxError exception, which is an error that occurs when the code does not follow the rules of the Python language. The code does not handle the exception, and therefore it will terminate with an error message.

The expected result of the code is an unhandled exception, because the code uses the global keyword incorrectly. Therefore, the correct answer is A. The code is erroneous and cannot be run.

NEW QUESTION # 35

What is the expected output of the following code?

PYTHON
INSTITUTE
Open Education & Development Group

```
def runner(brand, model="", year=2021, convertible=False):
    return (brand, str(year), str(convertible))

print(runner(model = "Furious", brand = "Ampere")[1][1])
```

- A. ('Ampere*', '2021', 'False')
- B. 0
- C. 1
- D. The code raises an unhandled exception.

Answer: B

NEW QUESTION # 36

Insert the code boxes in the correct positions in order to build a line of code which asks the user for an integer value and assigns it to the depth variable.

(Note: some code boxes will not be used.)

validvce.com

PYTHON INSTITUTE
Open Education & Development Group

Answer:

Explanation:

validvce.com

PYTHON INSTITUTE
Open Education & Development Group

Explanation

One possible way to insert the code boxes in the correct positions in order to build a line of code which asks the user for an integer value and assigns it to the depth variable is:

```
depth = int(input("Enter the immersion depth: "))
```

This line of code uses the input function to prompt the user for a string value, and then uses the int function to convert that string value into an integer number. The result is then assigned to the variable depth.

You can find more information about the input and int functions in Python in the following references:

[Python input() Function]

[Python int() Function]

NEW QUESTION # 37
