Best of luck in SAP C-BW4H-2404 exam and career

With the pass rate reaching 98.75%, our C-BW4H-2404 test materials have gained popularity in the international market. Many candidates have recommended our products to their friends. In addition, C-BW4H-2404 exam materials are edited by skilled professionals, and they possess the professional knowledge for the exam, therefore you can use the exam materials at ease. Free demo for C-BW4H-2404 Exam Dumps are available, and you can have a try before buying, so that you can have a better understanding of what you are going to buy.

SAP Certified Associate - Data Engineer - Data Fabric Sample Questions (Q31-Q36):

NEW QUESTION # 31

You have already loaded data from a non-SAP system into SAP Datasphere. You want to federate this data with data from an InfoCube of your SAP BW powered by SAP HANA.

What do you need to use to combine the data?

- A. SAP BW Shell Migration
- B. SAP BW Remote Migration
- C. SAP ABAP Connection

- D. SAP BW/4HANA Model Transfer

Answer: C

Explanation:

To federate data between SAP Datasphere and an InfoCube in SAP BW powered by SAP HANA, you need to establish a connection that allows SAP Datasphere to access the data stored in the InfoCube. Below is an explanation of the options:

* Explanation: This is the correct answer. An SAP ABAP Connection allows SAP Datasphere to connect to an SAP BW system and access its data objects, including InfoCubes. This connection leverages the ABAP stack to enable seamless integration between SAP Datasphere and SAP BW.

NEW QUESTION # 32

What are the benefits of separating master data from transactional data in SAP BW/4HANA? Note: There are 3 correct answers to this question.

- A. Ensuring referential integrity of your transactional data
- B. Allowing different data load frequency
- C. Providing language-dependent master data texts
- D. Reducing the number of database tables
- E. Avoiding generation of SID values

Answer: A,B,C

Explanation:

Separating master data from transactional data in SAP BW/4HANA offers the following benefits:

* Allowing Different Data Load Frequency (Answer B):

* Master data and transactional data have different update cycles. Separating them allows each to be loaded and updated independently based on business requirements.

* Ensuring Referential Integrity (Answer C):

* Master data ensures consistent referencing for transactional records, maintaining data integrity in reports and analyses.

* Providing Language-Dependent Texts (Answer D):

* Master data supports multi-language text descriptions, enhancing usability in global environments.

* Reducing Database Tables (Option A): The separation does not reduce database tables but organizes them more effectively.

* Avoiding Generation of SID Values (Option E): SID generation is required for master data referencing and is a key feature, not an issue to avoid.

Incorrect Options: References:

* SAP Help Portal - Master Data and Transactional Data Separation

* SAP BW/4HANA Architecture Guide

NEW QUESTION # 33

A user has the analysis authorization for the Controlling Areas 1000 2000.

In the InfoProvider there are records for Controlling Areas 1000 2000 3000 4000. The user starts a data preview on the InfoProvider.

Which data will be displayed?

- A. Only the aggregated total of all Controlling Areas
- B. Data for Controlling Areas 1000 2000 the aggregated total of 3000 4000
- C. Data for Controlling Areas 1000 2000
- D. No data for any of the Controlling Areas

Answer: C

Explanation:

* Analysis Authorization in SAP BW/4HANA: Analysis authorizations are used to restrict data access for users based on specific criteria, such as organizational units (e.g., Controlling Areas). These authorizations ensure that users can only view data they are authorized to access.

* InfoProvider: An InfoProvider is a data storage object in SAP BW/4HANA that holds data for reporting and analysis. When a user performs a data preview on an InfoProvider, the system applies the user's analysis authorizations to filter the data accordingly.

* Data Preview Behavior: During a data preview, the system evaluates the user's analysis authorizations and displays only the data

that matches the authorized values. Unauthorized data is excluded from the result set.

* The user has analysis authorization for Controlling Areas 1000 and 2000.

* The InfoProvider contains records for Controlling Areas 1000, 2000, 3000, and 4000.

* When the user starts a data preview on the InfoProvider:

* The system applies the user's analysis authorization.

* Only data for the authorized Controlling Areas (1000 and 2000) will be displayed.

* Data for unauthorized Controlling Areas (3000 and 4000) will be excluded from the result set.

* B. No data for any of the Controlling Areas: This would only occur if the user had no valid analysis authorization or if there were no matching records in the InfoProvider. However, since the user is authorized for Controlling Areas 1000 and 2000, data for these areas will be displayed. Incorrect.

* C. Only the aggregated total of all Controlling Areas: Aggregation across all Controlling Areas would violate the principle of analysis authorization, which restricts data access to authorized values.

Unauthorized data (3000 and 4000) cannot contribute to the aggregated total. Incorrect.

* D. Data for Controlling Areas 1000 2000 the aggregated total of 3000 4000: Unauthorized data (3000 and 4000) cannot be included in any form, even as part of an aggregated total. The system strictly excludes unauthorized data from the result set. Incorrect.

Key Concepts: Scenario Analysis: Why Other Options Are Incorrect: Why Option A Is Correct: The system applies the user's analysis authorization and filters the data accordingly. Since the user is authorized for Controlling Areas 1000 and 2000, only data for these areas will be displayed during the data preview.

* SAP BW/4HANA Security Guide: The official guide explains how analysis authorizations work and their impact on data visibility in queries and data previews.

* SAP Note on Analysis Authorizations: Notes such as 2508998 provide detailed guidance on configuring and troubleshooting analysis authorizations.

* SAP Best Practices for Data Security: These guidelines emphasize the importance of restricting data access based on user roles and authorizations.

References: By leveraging analysis authorizations, organizations can ensure that users only access data they are authorized to view, maintaining compliance and data security.

NEW QUESTION # 34

What is the request handling default setting for error handling in a data transfer process (DTP) in SAP BW/4HANA?

- A. Request is set to failed, error stack is written, and valid records are updated
- B. Request is canceled, records are not tracked, and target is not updated
- C. Request is canceled, first incorrect record is tracked, and target is not updated.
- D. Request is set to success, error stack is written, and valid records are updated

Answer: B

NEW QUESTION # 35

You create a DataStore Object(advanced) using the Data Mart DataStore Object modeling property. Which behaviors are specific to this modelling property? Note: There are 2 correct answers to this question.

- A. Reporting is done based on a union of the inbound and active tables
- B. The change log table will be filled only after data activation
- C. The records are treated as if all characteristics are in the key.
- D. Query results are shown only when data has been activated

Answer: A,C

Explanation:

* B. Reporting is done based on a union of the inbound and active tables: This is a behavior that is specific to the Data Mart DataStore Object modeling property. The query reads data from both the inbound table and the active table of the DataStore object, which means that it is not necessary to activate the data to be able to see all the data. The data read is consistent and stable, since data is only included up to the first inconsistent request12.

* D. The records are treated as if all characteristics are in the key: This is a behavior that is specific to the Data Mart DataStore Object modeling property. No keys can be specified for this type of DataStore object, but when the data is activated, it is grouped according to the aggregation behavior of all characteristics. Therefore, key figures cannot be overwritten and only additive deltas can be loaded12.
