Fortinet NSE 4 - FortiOS 7.6 Administrator Sample Questions (Q11-Q16):

NEW QUESTION # 11
You have configured the FortiGate device for FSSO. A user is successful in log-in to windows, but their access to the internet is denied.

What should the administrator check first?

- A. Whether the user is assigned to the correct AD group.
- B. The windows event viewer for failed login attempts.
- C. The FortiGate FSSO active users list for user's IP address.
- D. The FortiGate firewall policy settings for SSL decryption.

Answer: C

Explanation:
Checking the active users list verifies if FortiGate correctly associates the user with their IP address, ensuring proper policy enforcement for internet access.

NEW QUESTION # 12
Refer to the exhibits. You have implemented the application sensor and the corresponding firewall policy as shown in the exhibits.
You cannot access any of the Google applications, but you are able to access www.fortinet.com.
What would you do to resolve this issue?

Priority	Details	Type	Action
1	**BHVR** Excessive-Bandwidth	Filter	🚫 Block
2	**VEND** Google	Filter	👁 Monitor

②

- A. Change the Inspection mode to Proxy-based.
- B. Set SSL inspection to deep-content-inspection.
- C. Add *Google*.com to the URL category in the security profile.
- D. Move up Google in the Application and Filter Overrides section to set its priority to 1.

Answer: D

Explanation:
In the Application and Filter Overrides, the Excessive-Bandwidth filter (set to Block) is priority 1, and Google (set to Monitor) is priority 2. Since overrides are evaluated by priority, Google traffic is being blocked by the higher-priority rule. Moving Google to the top (priority 1) ensures it is matched first, allowing access while still monitoring it.

NEW QUESTION # 13
Which three statements explain a flow-based antivirus profile? (Choose three.)

- A. The IPS engine handles the process as a standalone.
- B. Flow-based inspection optimizes performance compared to proxy-based inspection.
- C. Flow-based inspection uses a hybrid of the scanning modes available in proxy-based inspection.
- D. FortiGate buffers the whole file but transmits to the client at the same time.
- E. If a virus is detected, the last packet is delivered to the client.

Answer: B,C,D

Explanation:
Flow-based antivirus buffers the entire file while simultaneously transmitting data to the client to minimize latency.
Flow-based inspection combines multiple scanning techniques from proxy-based modes for efficient detection.
Flow-based inspection provides better performance by processing traffic on the fly without full proxy overhead.

NEW QUESTION # 14

A network administrator has configured an SSL/SSH inspection profile defined for full SSL inspection and set with a private CA certificate. The firewall policy that allows the traffic uses this profile for SSL inspection and performs web filtering. When visiting any HTTPS websites, the browser reports certificate warning errors.

What is the reason for the certificate warning errors?

- A. The browser does not recognize the certificate in use as signed by a trusted CA.
- B. With full SSL inspection it is not possible to avoid certificate warning errors at the browser level.
- C. The certificate used by FortiGate for SSL inspection does not contain the required certificate extensions.
- D. The SSL cipher compliance option is not enabled on the SSL inspection profile. This setting is required when the SSL inspection profile is defined with a private CA certificate.

Answer: A

Explanation:
The certificate warning errors occur because the SSL inspection profile is configured to use a private CA certificate that is not recognized by the browser as being signed by a trusted CA. For the browser to trust the FortiGate's re-signed certificates, the CA certificate used by FortiGate for SSL inspection must be installed in the browser's trusted certificate store. Until the browser recognizes the certificate authority (CA) as trusted, it will continue to display warning errors when accessing HTTPS websites.

NEW QUESTION # 15

Refer to the exhibit showing a debug flow output.

Debug Flow output

Denied by forward policy check (policy 2)
```

Which two conclusions can you make from the debug flow output? (Choose two.)

- A. The matching firewall policy denies the traffic.
- B. The default gateway is configured on port2.
- C. The RPF check fails.
- D. The debug flow is for UDP traffic.

Answer: A,B

Explanation:
The default gateway is configured on port2 → The debug output shows find a route:
flag=00000000 gw-0.0.0.0 via port2, which indicates that the default route (0.0.0.0/0) points out port2.
The matching firewall policy denies the traffic → The log line Denied by forward policy check (policy 2) confirms that policy 2
matched and explicitly dropped the traffic.
