Latest Amazon DVA-C02 of exam practice questions and answers free download

In today's highly competitive Amazon market, having the DVA-C02 certification is essential to propel your career forward. To earn the Amazon DVA-C02 certification, you must successfully pass the DVA-C02 Exam. However, preparing for the Amazon DVA-C02 exam can be challenging, with potential hurdles like exam anxiety and time constraints.

Amazon DVA-C02 Exam Tests candidates on a variety of topics related to AWS development, including AWS core services, security, database, and deployment. DVA-C02 exam is designed to assess a candidate's ability to design, develop, and deploy secure and scalable AWS applications using best practices and AWS services.

Amazon AWS Certified Developer - Associate Sample Questions (Q142-Q147):

NEW QUESTION # 142

A developer maintains a critical business application that uses Amazon DynamoDB as the primary data store. The DynamoDB table contains millions of documents and receives 30-60 requests each minute. The developer needs to perform processing in near-real time on the documents when they are added or updated in the DynamoDB table. How can the developer implement this feature with the LEAST amount of change to the existing application code?

- A. Update the application to send a PutEvents request to Amazon EventBridge. Create an EventBridge rule to invoke an AWS Lambda function to process the documents.
- **B. Enable a DynamoDB stream on the table. Invoke an AWS Lambda function to process the documents.**
- C. Update the application to synchronously process the documents directly after the DynamoDB write.
- D. Set up a cron job on an Amazon EC2 instance. Run a script every hour to query the table for changes and process the documents.

Answer: B

Explanation:

NEW QUESTION # 143

A developer is developing an application that uses signed requests (Signature Version 4) to call other AWS services. The developer has created a canonical request, has created the string to sign, and has calculated signing information. Which methods could the developer use to complete a signed request? (Choose two.)

- A. Add the signature to a session cookie.
- B. Add the signature to an HTTP header that is named Authentication.
- C. Add the signature to an HTTP header that is named WWW-Authenticate.
- **D. Add the signature to an HTTP header that is named Authorization.**
- **E. Add the signature to a query string parameter that is named X-Amz-Signature.**

Answer: D,E

NEW QUESTION # 144

A company runs a new application on AWS Elastic Beanstalk. The company needs to deploy updates to the application. The updates must not cause any downtime for application users. The deployment must forward a specified percentage of incoming client traffic to a new application version during an evaluation period. Which deployment type will meet these requirements?

- A. Immutable
- B. In-place
- **C. Traffic-splitting**
- D. Rolling

Answer: C

Explanation:

AWS Elastic Beanstalk supports several deployment policies, and in this case, the requirement is to forward a specific percentage of traffic to the new version without causing downtime. The Traffic-splitting deployment policy is the most appropriate choice.

- * Traffic-splitting Deployment: This deployment method allows you to gradually shift a specified percentage of incoming traffic from the old environment version to the new one. During the evaluation period, if any issues are detected, the traffic can be redirected back to the old version.
- * No Downtime: This method ensures no downtime since both versions of the application run concurrently, and traffic is split between them.
- * Alternatives:
- * Rolling deployments (Option A): These gradually replace instances but may result in partial downtime if some instances fail during deployment.
- * In-place deployments (Option C): In-place deployments replace instances without creating new ones, which can lead to downtime.
- * Immutable deployments (Option D): While this ensures no downtime by creating entirely new instances, it doesn't provide traffic splitting during the evaluation phase.

NEW QUESTION # 145

A developer is creating an application that will store personal health information (PHI). The PHI needs to be encrypted at all times. An encrypted Amazon RDS for MySQL DB instance is storing the data. The developer wants to increase the performance of the application by caching frequently accessed data while adding the ability to sort or rank the cached datasets. Which solution will meet these requirements?

- A. Create an Amazon DynamoDB table and a DynamoDB Accelerator (DAX) cluster for the table. Store frequently accessed data in the DynamoDB table.
- B. Create an Amazon ElastiCache for Memcached instance. Enable encryption of data in transit and at rest. Store frequently accessed data in the cache.
- C. Create an Amazon RDS for MySQL read replica. Connect to the read replica by using SSL. Configure the read replica to store frequently accessed data.
- **D. Create an Amazon ElastiCache for Redis instance. Enable encryption of data in transit and at rest. Store frequently accessed data in the cache.**

Answer: D

Explanation:

Explanation

Amazon ElastiCache is a service that offers fully managed in-memory data stores that are compatible with Redis or Memcached. The developer can create an ElastiCache for Redis instance and enable encryption of data in transit and at rest. This will ensure that the PHI is encrypted at all times. The developer can store frequently accessed data in the cache and use Redis features such as sorting and ranking to enhance the performance of the application.

NEW QUESTION # 146

A company uses AWS CloudFormation templates to manage infrastructure for a public-facing application in its development, pre-production, and production environments. The company needs to scale for increasing customer demand. A developer must upgrade the Amazon RDS DB instance type to a larger instance.

The developer deploys an update to the CloudFormation stack with the instance size change in the pre-production environment. The developer notices that the stack is in an UPDATE_ROLLBACK_FAILED state in CloudFormation.

Which option is the cause of this issue?

- A. The new instance type specified in the CloudFormation template is invalid
- **B. The database was deleted or modified manually outside of the CloudFormation stack**
- C. The developer has insufficient IAM permissions to provision an instance of the specified type
- D. There is a syntax error in the CloudFormation template

Answer: B
