1. Cloud Computing - ANSWER ✓ The on-demand delivery of IT resources over the Internet with pay-as-you-go pricing.
2. Cloud Deployment Model: Cloud - ANSWER ✓ Fully deployed in the cloud; all parts of the application run on AWS.
3. Cloud Deployment Model: Hybrid - ANSWER ✓ Connects on-premises infrastructure to cloud infrastructure.
4. Cloud Deployment Model: On-Premises (Private Cloud) - ANSWER ✓ Uses virtualization and resource management tools in a company's own data center; not true cloud computing.
5. Benefit of Cloud: Trade CapEx for OpEx - ANSWER ✓ Avoids large upfront investments in hardware (Capital Expense) and pays only for what you use (Operational Expense).
6. Benefit of Cloud: Economies of Scale - ANSWER ✓ AWS's massive scale allows them to offer lower prices than if a company ran its own data center.
7. Benefit of Cloud: Stop Guessing Capacity - ANSWER ✓ You can scale resources up or down automatically, so you don't have to predict usage.
8. Benefit of Cloud: Increase Speed and Agility - ANSWER ✓ Resources are available with a few clicks, reducing the time to make them available to developers from weeks to minutes.

WGU Cloud Deployment and Operations Sample Questions (Q35-Q40):

NEW QUESTION # 35

(Which two languages are used by CloudFormation to define infrastructure? Choose 2 answers.)

- A. XML
- B. JSON
- C. YAML
- D. C#

Answer: B,C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

AWS CloudFormation uses YAML and JSON languages to define infrastructure as code (IaC) templates, specifying resources, parameters, and configurations. These formats are human-readable and support the creation of stacks for provisioning AWS resources. The WGU Cloud Deployment and Operations Study Guide (Section 5.3, CloudFormation) states, "CloudFormation templates can be written in YAML or JSON, both of which are supported for defining infrastructure resources like EC2 instances and S3 buckets." XML and C# are not supported languages for CloudFormation templates.

NEW QUESTION # 36

(Which action must be used to create a metric filter in the Amazon CloudWatch console?)

- A. Specify a stream
- B. Select a log group
- C. Define a trace
- D. Enable an alarm

Answer: B

Explanation:

To create a metric filter in the Amazon CloudWatch console, the first step is to select a log group from which the log data will be analyzed. A log group contains log streams, and metric filters are applied to the log data within these groups to extract metrics based on patterns. The WGU Cloud Deployment and Operations Study Guide (Section 4.2, CloudWatch Logs) specifies that the process begins by navigating to the CloudWatch console, selecting a log group, and then defining the filter pattern. Actions like enabling an alarm, defining a trace, or specifying a stream are subsequent or unrelated steps.

NEW QUESTION # 37

(What is a patch baseline attached to if it is not defined in Patch Manager?)

- A. Default patch group
- B. Baseline data set
- C. Patch process
- D. Accelerate patch baseline

Answer: A

Explanation:

If a patch baseline is not explicitly defined in Patch Manager, it is attached to the default patch group. This default group applies a preconfigured baseline with AWS-recommended patches, ensuring basic compliance for instances without custom baselines. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Patch Manager) states, "If no custom patch baseline is defined, instances are associated with the default patch group, which uses AWS-provided baseline settings for automatic patch approval." Options A, C, and D are not valid attachments for patch baselines.

NEW QUESTION # 38

(An administrator sees the following VPC flow log: 2 123456739010 eni-123bfecad12529 192.168.20.1 203.0.113.66 2066 22 20 7782 1645859356 1645859536 ACCEPT OK. What does the log indicate about the traffic flow?)

- A. Traffic from 203.0.113.66 to 192.168.20.1 with a source port of 22 has been permitted.
- B. Traffic from 192.168.20.1 to 203.0.113.66 with a source port of 2066 has been permitted.
- **C. Traffic from 192.168.20.1 to 203.0.113.66 with a destination port of 2066 has been permitted.**
- D. Traffic from 203.0.113.66 to 192.168.20.1 with a destination port of 2066 has been permitted.

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The VPC flow log fields indicate the following: the source IP is 192.168.20.1, the destination IP is 203.0.113.66, the source port is 2066, the destination port is 22, and the action is "ACCEPT OK," meaning the traffic was permitted. This shows outbound traffic from the internal network (192.168.20.1) to an external IP (203.0.113.66) with destination port 2066. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, VPC Flow Logs) states, "In a flow log, the format includes source IP, destination IP, source port, destination port, and action; for example, 192.168.20.1 to 203.0.113.66 with source port 2066 and destination port 22 indicates permitted outbound traffic." Only option C correctly interprets this flow.

NEW QUESTION # 39

(Which AWS solution can be used to send events from Shopify?)

- A. IoT Events
- **B. EventBridge**
- C. Service events
- D. CloudTrail events

Answer: B

Explanation:

Amazon EventBridge is the AWS solution that can be used to send events from external sources like Shopify.

EventBridge supports integration with third-party applications through its event bus, allowing custom events (e.g., from Shopify via webhooks) to be ingested and routed to AWS services or targets. The WGU Cloud Deployment and Operations Study Guide (Section 4.3, EventBridge) notes that EventBridge is designed for event ingestion from SaaS applications, making it suitable for Shopify integration. CloudTrail, IoT Events, and Service events are not designed for this purpose.
