Fortinet NSE 6 - FortiSwitch 7.2 Sample Questions (Q23-Q28):

NEW QUESTION # 23

Which two statements about 802.1X authentication on FortiSwitch ports are true? (Choose two.)

- A. A security policy is used to apply 802.1 authentication on a port.
- B. A local user database must be used to authenticate devices using the 802.1X authentication protocol.
- C. All hosts behind an authenticated port are allowed access after a successful authentication.
- D. All devices connecting to FortiSwitch must support 802.1X authentication.

Answer: C,D

Explanation:

All hosts behind an authenticated port are allowed access after a successful authentication (A): Once a device on a port successfully authenticates using 802.1X, all other devices connected behind that port also gain network access. This is typical in scenarios where a switch is behind an authenticated port and not each device individually authenticates.

All devices connecting to FortiSwitch must support 802.1X authentication (D): For a network secured with 802.1X, all devices attempting to connect through the FortiSwitch must support and participate in 802.1X authentication to gain access. This ensures that all devices on the network are authenticated before they are allowed to communicate on the network.

NEW QUESTION # 24

Which QoS mechanism maps packets with specific CoS or DSCP markings to an egress queue?

- A. Marking for ingress traffic
- B. Rate limiting for egress traffic
- C. Classification for ingress traffic

Which two statements best describe what is displayed in the FortiLink debug output shown in the exhibit? (Choose two.)

- A. FortiSwitch is ready to push its new hostname to FortiGate.
- B. FortiSwitch is in a waiting state to join the stack group on FortiGate.
- C. FortiSwitch is discovered and authorized by FortiGate.
- D. FortiSwitch is sending FortiLink heartbeats to FortiGate.

Answer: C,D

Explanation:

The provided debug output indicates that the FortiSwitch is sending FortiLink heartbeats to the FortiGate and is currently waiting to join the stack group. Here's a breakdown of the relevant lines:

Line 1: Shows the date, time, elapsed time since boot, and process ID for the FortiLink event handler.

573s:160ms: 74us translates to roughly 573 seconds, 160 milliseconds, and 74 microseconds since uptime.

Event 101: This indicates the FortiSwitch is in a "wait join" state (FL_STATE_WAIT_JOIN). This means it's discovered by the FortiGate and is awaiting further instructions to join the FortiLink stack group.

switchname S424DPTF20000029: This displays the serial number of the FortiSwitch.

flags 0x401: The specific flag meaning might depend on the FortiSwitch model and version, but it likely indicates general communication between the switch and FortiGate.

Lines 2 and onward: These lines show subsequent events with similar timestamps, suggesting a regular heartbeat interval. There are also instances of the FortiSwitch sending packets to the FortiGate (indicated by pkt-sent).

Why the Other Options Are Less Likely:

C . FortiSwitch is discovered and authorized by FortiGate. While discovery might have happened before these lines, the "wait join" state suggests authorization hasn't necessarily completed yet.

D . FortiSwitch is ready to push its new hostname to FortiGate. There's no explicit indication of hostname changes in this excerpt. The focus is on joining the stack group.

In Summary:

The key point is the "FL_STATE_WAIT_JOIN" state, which signifies the FortiSwitch is ready to be fully integrated but is waiting for further commands from the FortiGate to complete the process.

NEW QUESTION # 26

Which feature should you enable to reduce the number of unwanted IGMP reports processed by the IGMP querier?

- **A. Enable IGMP snooping proxy.**
- B. Enable IGMP flood unknown multicast traffic on the global setting.
- C. Enable the IGMP flood reports setting on the mRouter port.
- D. Enable the IGMP flood setting on the static port for all multicast groups.

Answer: A

NEW QUESTION # 27

Which statement about the quarantine VLAN on FortiSwitch is true?

- **A. Users who fail 802.1X authentication can be placed on the quarantine VLAN.**
- B. FortiSwitch can block devices without configuring quarantine VLAN to be part of the allowed VLANs.
- C. It is only used for quarantined devices if global setting is set to quarantine by VLAN.
- D. Quarantine VLAN has no DHCP server

Answer: A

Explanation:

The correct statement about the quarantine VLAN on FortiSwitch is:

B . Users who fail 802.1X authentication can be placed on the quarantine VLAN. This feature allows network administrators to isolate devices that do not meet the network's security criteria as determined through 802.1X authentication. Placing these devices in a quarantine VLAN restricts their network access, thereby protecting the network from potential security threats posed by unauthorized or compromised devices.

Option A is incorrect as the presence of a DHCP server in a quarantine VLAN depends on specific network configurations. Option C is incorrect without more context regarding global settings, and option D misstates the functionality of quarantine VLANs, as their primary use is to restrict, not block, devices without additional VLAN configuration changes.
