CAS-004 Reliable Test Camp - CAS-004 Download

The 24/7 support system is there for the students to assist them in the right way and solve their real issues quickly. The Pass4guide CompTIA CAS-004 can be used instantly after buying it from us. Free demos and up to 1 year of free updates are also available at SITE. Buy the Pass4guide CompTIA CAS-004 Now and Achieve Your Dreams With Us!

CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q605-Q610):

NEW QUESTION # 605

A company is outsourcing to an MSSP that performs managed detection and response services. The MSSP requires a server to be placed inside the network as a log aggregate and allows remote access to MSSP analyst. Critical devices send logs to the log aggregator, where data is stored for 12 months locally before being archived to a multitenant cloud. The data is then sent from the log aggregator to a public IP address in the MSSP datacenter for analysis.

A security engineer is concerned about the security of the solution and notes the following.

* The critical device send cleartext logs to the aggregator.

- Which of the following should be the engineer's GREATEST concern?

- Answer: D**

Encryption of data in transit should be the engineer's greatest concern regarding the security of the solution. Data in transit refers to data that is being transferred over a network or between devices. If data in transit is not encrypted, it can be intercepted, modified, or stolen by attackers who can exploit vulnerabilities in the network protocols or devices. The solution in the question sends logs from the critical devices to the aggregator in plaintext and from the aggregator to the analysis server via port 80, which are both insecure methods that expose the data to potential attacks. A company that uses AD is migrating services from LDAP to secure LDAP. During the pilot phase, services are not connecting properly to secure LDAP. Block is an except of output from the troubleshooting session:

Which of the following BEST explains why secure LDAP is not working? (Select TWO.)

- Answer: A,F**

The clients may not trust idapt by default because it is a self-signed certificate authority that is not in the trusted root store of the clients. Secure LDAP does not support wildcard certificates because they do not match the fully qualified domain name of the server. An organization is moving its intellectual property data from on premises to a CSP and wants to secure the data from theft. Which of the following can be used to mitigate this risk?

- Answer: D**

The company should use an additional layer of encryption to secure the data from theft when moving to a CSP. Encryption is a

process of transforming data into an unreadable format using a secret key. Encryption can protect the data from unauthorized access or modification during transit and at rest. Encryption can be applied at different levels, such as disk, file, or application. An additional layer of encryption can provide an extra security measure on top of the encryption provided by the CSP. Verified References:

NEW QUESTION # 608

An organization is in frequent litigation and has a large number of legal holds. Which of the following types of functionality should the organization's new email system provide?

- A. E-discovery
- B. Privacy-level agreements
- C. Encryption
- D. DLP

Answer: A

Explanation:

The organization's new email system should provide e-discovery functionality. E-discovery stands for electronic discovery, which is the process of identifying, preserving, collecting, processing, reviewing, analyzing, and producing electronically stored information (ESI) that is relevant to a legal matter. E-discovery can help the organization comply with legal holds, which are orders or notices to preserve relevant ESI when litigation is anticipated or ongoing. E-discovery can also help the organization reduce the costs and risks of litigation, as well as improve the efficiency and accuracy of the discovery process.

NEW QUESTION # 609

A junior developer is informed about the impact of new malware on an Advanced RISC Machine (ARM) CPU, and the code must be fixed accordingly. Based on the debug, the malware is able to insert itself in another process memory location.

Which of the following technologies can the developer enable on the ARM architecture to prevent this type of malware?

- A. Virtual memory encryption
- B. No-execute
- C. Execute never
- D. Total memory encryption

Answer: B

NEW QUESTION # 610

.....

Our CAS-004 learning guide materials have won the favor of many customers by virtue of their high quality. Started when the user needs to pass the qualification test, choose the CAS-004 real questions, they will not have any second or even third backup options, because they will be the first choice of our practice exam materials. Our CAS-004 Practice Guide is devoted to research on which methods are used to enable users to pass the test faster. Therefore, through our unremitting efforts, our CAS-004 real questions have a pass rate of 98% to 100%.
