ISTQB (ISTQB CTAL-TA) ISTQB Certified Tester Advanced Level - Test Analyst (Syllabus 2012) Sample Questions (Q80-Q85):

NEW QUESTION # 80

Consider the following user story: As a student, I want to be able to buy a parking pass (priority: high) Acceptance criteria

- The student will not receive the parking pass if the payment is insufficient.
- Only registered students can buy a parking pass.
- The student can only buy one parking pass each month.

Which of the following checklist items would result in finding a defect for the user story?

- A. Is the story written from the view of the person who requested it?
- B. Does the story follow the commonly used format "As a <>, I want <> so that <>?"
- **C. Are the acceptance criteria defined and testable?**
- D. Is the story prioritized?

Answer: C

Explanation:

The checklist item that would result in finding a defect for the user story is "Are the acceptance criteria defined and testable?". The acceptance criteria are the conditions that a system or component must satisfy in order to be accepted by a user, customer, or other authorized entity. The acceptance criteria should be defined and testable for each user story, as they provide the basis for designing and executing test cases. The user story in this question does not have any acceptance criteria defined, which is a defect that needs to be addressed. NEW QUESTION # 81

You are asked to select the test conditions that address functional suitability, portability, usability, and accessibility for Iteration 1 (iOS only) of a new energy monitor application.

SELECT ONE OPTION

- A. e, e
- B. a, b
- **C. a, e**
- D. b, d

Answer: C

Explanation:

Comprehensive and Detailed in Depth Explanation:

Since Iteration 1 focuses on the iOS operating system only, we must select test conditions that address functional suitability, portability, usability, and accessibility specifically for iOS.

* a) The application will accept voice recognition commands made via iOS devices: This addresses accessibility (support for voice commands).

* e) The application can be installed on all currently supported versions of iOS for all supported smartphones and tablets: This addresses portability (installation on different iOS versions and devices).

* b) The application is both learnable and operable for customers when used on Android devices:

This is not applicable for Iteration 1.

* c) There is no loss or corruption of data transmitted between the energy monitor and other smart-home products: This addresses reliability, not portability or usability.

* d) The daily budget usage is accurately calculated from seasonal historic data running on Android: This is related to Iteration 3, not 1.

Therefore, the correct answer is A (a, e).

NEW QUESTION # 82

You work for an insurance company that is running several parallel projects. You need to recommend the best approach for test case design for each project.

* Project C: Previous releases had vague and inconsistent requirements. More formal reviews have been introduced to improve quality.

* Project D: Emphasis on regression testing, with most test cases forming part of the regression pack, initially manual but planned for automation.

SELECT ONE OPTION

- A. Project C - Low level test cases. Project D - High level test cases
- B. Project C - Low level test cases. Project D - Low level test cases
- C. Project C - High level test cases. Project D - High level test cases
- **D. Project C - High level test cases. Project D - Low level test cases**

Answer: D

Explanation:

Comprehensive and Detailed in Depth Explanation:

* Project C: Since the requirements are vague and inconsistent, creating high-level test cases is more suitable. High-level test cases are flexible and allow for interpretation, which is crucial when requirements are not clearly defined.

* Project D: Since the project aims for regression testing, low-level test cases are more appropriate. They are detailed and specific, essential for consistency during repeated manual or automated regression testing.

Therefore, the correct answer is D (Project C - High level test cases. Project D - Low level test cases).

NEW QUESTION # 83

To enhance both the effectiveness and efficiency of the test design phase, the purchase of a test design tool is being considered. Which one of these statements best characterizes a test design tool?

- A. A test design tool enables individual tests to be traced to requirements
- B. A test design tool enables tests to be executed automatically.
- **C. A test design tool generates test inputs from requirements**
- D. A test design tool validates models of the software.

Answer: C

Explanation:

The statement that best characterizes a test design tool is that a test design tool generates test inputs from requirements. A test design tool is a tool that supports the test design activity by generating test inputs or test cases from a specified source, such as requirements, models, or code. A test design tool can use various techniques, such as equivalence partitioning, boundary value analysis, decision tables, state transition diagrams, etc., to generate test inputs or test cases. NEW QUESTION # 84

When preparing test cases for an interoperability test, not all interactions may be clearly specified in the requirements documents. Which type of document is typically also used by a Test Analyst as the test basis for interoperability testing?

- **A. System architecture document**
- B. Functional specifications
- C. User stories
- D. Component specifications

Answer: A

Explanation:

The type of document that is typically used by a Test Analyst as the test basis for interoperability testing is the system architecture document. The system architecture document describes the structure and behavior of the system under test and its components, as well as their interactions and dependencies with other systems or components. This document can provide information about the interfaces and protocols that need to be tested for interoperability.
