hope. You can get the Cloud-Deployment-and-Operations certification easily with our Cloud-Deployment-and-Operations learning questions and have a better future.

WGU Cloud Deployment and Operations Sample Questions (Q13-Q18):

NEW QUESTION # 13

(Which AWS CloudFormation feature should be used to specify the AWS resources to be provisioned?)

- A. StackSet
- B. Exports
- **C. Template**
- D. Change set

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The CloudFormation template feature should be used to specify the AWS resources to be provisioned. A template is a JSON or YAML file that defines the resources (e.g., EC2 instances, S3 buckets) and their configurations for deployment. The WGU Cloud Deployment and Operations Study Guide (Section 5.3, CloudFormation Templates) states, "The template is the core component of CloudFormation, containing the resource specifications and properties that are provisioned when a stack is created." Change sets, exports, and stack sets serve different purposes (e.g., previewing changes, sharing outputs, managing multiple stacks).

NEW QUESTION # 14

(A company configures the CloudFront caching TTL to the following settings: Min: 0, Max: 172800. An administrator updates the Cache-Control setting to 432000. However, objects are only cached for 48 hours.

What is required to ensure objects are cached for up to 120 hours?)

- **A. Configure the Max setting for 432000**
- B. Configure the Cache-Control setting for 172800
- C. Configure the Min setting for 432000
- D. Configure the expiration setting for 172800

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Amazon CloudFront, the caching TTL is controlled by the minimum and maximum TTL settings, with the maximum TTL (in seconds) capping the cache duration. The current Max TTL is 172800 seconds (48 hours), and the Cache-Control setting of 432000 seconds (120 hours) is ignored because it exceeds the Max TTL. To cache objects for up to 120 hours, the Max setting must be configured to 432000 seconds. The WGU Cloud Deployment and Operations Study Guide (Section 4.4, CloudFront Caching) states, "The maximum TTL in CloudFront settings (e.g., 172800 seconds) overrides any higher Cache-Control value; to allow 120 hours (432000 seconds), the Max TTL must be set accordingly." Adjusting Min, expiration, or Cache-Control alone does not resolve this.

NEW QUESTION # 15

(An administrator needs to implement Amazon Route 53 multivalue routing policy. The operator must ensure that Route 53 will respond to incoming requests with the maximum allowed number of records. How many records should be created?)

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

The multivalue routing policy in Amazon Route 53 allows up to 8 healthy records to be returned in response to DNS queries, enabling load balancing across multiple resources. To ensure the maximum allowed number of records is utilized, the administrator

should create 8 records. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Routing Policies) specifies, "Multivalue answer routing supports up to 8 healthy resource record sets per response, requiring the creation of 8 records to maximize the policy's capability." Options A, C, and D exceed or fall short of this limit.

NEW QUESTION # 16

(Which two protocols are supported in security group rules? Choose 2 answers.)

- A. MPLS
- **B. ICMP**
- C. BGP
- **D. UDP**

Answer: B,D

Explanation:

Security group rules in AWS support the Internet Control Message Protocol (ICMP) and User Datagram Protocol (UDP) for defining inbound and outbound traffic rules. These protocols are commonly used for network communication and monitoring. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Security Groups) states, "Security groups support protocols like ICMP for diagnostic traffic and UDP for streaming or low-latency applications, allowing fine-grained control over instance access." BGP and MPLS are routing or network layer protocols not supported by security group rules.

NEW QUESTION # 17

(A company is using Route 53 for Domain Name System (DNS) hosting. The company requires a zone that should only be accessible from instances in a Virtual Private Cloud (VPC). Which type of hosted zone should be used?)

- A. Public Hosted Zone
- B. DNS Zone
- **C. Private Zone**
- D. Lightsail DNS Zone

Answer: C

Explanation:

A Private Hosted Zone in Amazon Route 53 should be used to restrict DNS resolution to instances within a Virtual Private Cloud (VPC), ensuring that the zone is only accessible internally. This isolates DNS services from public internet access. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Hosted Zones) states, "A Private Hosted Zone in Route 53 limits DNS resolution to resources within a specified VPC, preventing external access and enhancing security for internal services." Public Hosted Zones, DNS Zones, and Lightsail DNS Zones do not provide this VPC-specific restriction.
