## Latest Materials

We declare that we can ensure you 100% pass, because we have the real exam questions for the B2B-Commerce-Developer actual test. All the questions of Salesforce B2B-Commerce-Developer test pdf are taken from current pool of actual test, then after refined and checked, compiled into the complete dumps. Furthermore, the answers are correct and verified by our IT experts with decades of hands-on experience. So the high quality and accuracy of B2B-Commerce-Developer Cert Guide are without any doubt. With our 100 % pass rate history & money back guarantee, you can rest assured to choose our B2B-Commerce-Developer vce files.

Salesforce B2B Commerce Developer certification exam is designed to test the skills required to develop and implement B2B Commerce solutions. B2B-Commerce-Developer exam is typically 60 multiple-choice questions, and participants are required to obtain a passing score of 68% or higher to secure the certification. B2B-Commerce-Developer Exam covers various topics, including architecture, integration, development, debugging, and testing.

## Salesforce Accredited B2B Commerce Developer Sample Questions (Q189-Q194):

### NEW QUESTION # 189

Which two steps are necessary to enable Salesforce B2B Commerce logging in the managed package?

- A. Set a cookie with the Id of the user accessing the storefront in CC Admin
- **B. Ensure the value saved in the Logging token field is appended to the ccLog query parameter.**
- C. Turn On the Checkbox "Cloudcraze Logging" in CC Admin.
- **D. Ensure you save a value in the Logging Token input field in the Global Settings section of CC Admin.**

**Answer: B,D**

Explanation:

To enable Salesforce B2B Commerce logging in the managed package, you need to do two steps. First, you need to save a value in the Logging Token input field in the Global Settings section of CC Admin. This value can be any string that you choose, such as "debug". Second, you need to ensure that the value saved in the Logging token field is appended to the ccLog query parameter in the URL of the storefront page that you want to debug. For example, if your logging token is "debug", then your URL should look like this:

<https://my-storefront.com/?ccLog=debug>. This will enable logging for that page only. You do not need to turn on the checkbox "Cloudcraze Logging" in CC Admin, as this is an old setting that is no longer used. You also do not need to set a cookie with the Id of the user accessing the storefront in CC Admin, as this is not required for logging. Salesforce References: [B2B Commerce Developer Guide: Logging]

### NEW QUESTION # 190

The ccUtil apex class in Salesforce B2B Commerce provides numerous utility functions that can be leveraged in subscriber classes. Which command will return the value in the given Map if found or a default value in the event that the Map is null, empty, or an object is not found for that key?

- A. `ccrUtil.defaultValue(Map<String, Object> mp, String key, Object ob)`
- B. `ccrUtil.defv (Map<String, Object> mp, String key, Object ob)`
- **C. `ccrUtil.defVal (Map<String, Object> mp, String key, Object ob)`**
- D. `ccrUtil... (Map<String, Object> mp, String key, Object ob)`

**Answer: C**

Explanation:

The `ccrUtil.defVal (Map<String, Object> mp, String key, Object ob)` method will return the value in the given Map if found or a default value in the event that the Map is null, empty, or an object is not found for that key. This method is useful for providing fallback values for configuration settings or input parameters that may be missing or invalid. ### NEW QUESTION # 191

What is default behavior for how the Salesforce B2B Commerce Global APIs transform Salesforce data?

- A. Fields names are returned with "c." prepended in their name.
- B. Fields names are returned using the Salesforce naming convention.
- C. Fields names can be mapped to any naming convention desired
- **D. Fields names are returned with a lowercase first letter, camelcase convention**

**Answer: D**

#### NEW QUESTION # 192

How should data for Lightning web components be provided?

- A. One property that contains all data in one set (object)
- B. A single property object that contains sets (objects) of data
- C. A few properties that contain sets (objects) of data
- **D. Independent properties that take simpler, primitive values (e.g. String, Number, Boolean, Array)**

**Answer: D**

Explanation:

Explanation

Data for Lightning web components should be provided as independent properties that take simpler, primitive values (e.g. String, Number, Boolean, Array). Providing data as independent properties allows the developer to expose data as public or private properties of the Lightning web component and communicate data between components or services. Providing data as simpler, primitive values allows the developer to use data types that are supported by JavaScript and Lightning web components and avoid unnecessary or complex conversions or transformations. Providing data as a few properties that contain sets (objects) of data is not a good way to provide data for Lightning web components, as it can create confusion or inconsistency in data structure and access. Providing data as one property that contains all data in one set (object) is not a good way either, as it can create complexity or inefficiency in data management and manipulation. Providing data as a single property object that contains sets (objects) of data is not a good way either, as it can create redundancy or duplication in data storage and retrieval. #### NEW QUESTION # 193

Northern Trail Outfitters (NTO) has a B2B Commerce store for its resellers. It has received many customer service calls involving questions about the delivery date of customer orders.

How should a developer expose delivery time estimates to NTO's customers in the storefront to reduce call volume?

- A. Configure an email alert to the customer when the Expected Delivery Date changes.
- B. Add the Expected Delivery Date field to the order confirmation email.
- **C. Display the Expected Delivery Date on the order page with a Lightning web component.**
- D. Add a Desired Delivery Date input field during the checkout flow.

**Answer: C**

Explanation:

Explanation

To expose delivery time estimates to NTO's customers in the storefront, a developer should display the Expected Delivery Date on the order page with a Lightning web component. The Expected Delivery Date is a custom field on the Order object that stores the date when the order is expected to be delivered to the customer. The developer can use the @wire decorator to get the current order object and use its properties, such as order number, status, total amount, and expected delivery date, to display them on the order page. The developer can also use Apex methods or third-party APIs to calculate and update the expected delivery date based on various factors, such as inventory availability, shipping method, shipping address, and carrier service level. Displaying the expected delivery date on the order page allows the customer to see their delivery time estimate at any time and reduce their need to call customer service. Adding the Expected Delivery Date field to the order confirmation email is not a good solution, as it does not allow the customer to see their delivery time estimate if they lose or delete their email. Adding a Desired Delivery Date input field during the checkout flow is not a good solution either, as it does not guarantee that the customer's desired delivery date will be met or reflect any changes in delivery time due to unforeseen circumstances. Configuring an email alert to the customer when the Expected Delivery Date changes is not a good solution either, as it can create confusion or frustration for the customer if they receive multiple or conflicting emails about their delivery date.
