ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q77-Q82):

NEW QUESTION # 77

Which sequence of stated in the answer choices is correct in accordance with the following figure depicting the life-cycle of a defect?

- A. S0->S1->S2->S3->S5->S1
- B. S0->S1->S2->S3->S5->S1->S2->S3
- C. S0->S1 ->S2->S3->S5->S3->S4
- D. S0->S1->S2->S3->S4

Answer: C

Explanation:

According to the ISTQB Certified Tester Foundation Level (CTFL) v4.0, the life cycle of a defect typically follows a sequence from its discovery to its closure. In the provided figure, it starts with S0 (New), moves to S1 (Assigned), then to S2 (Resolved), followed by S3 (Verified). If the defect is not fixed, it can be Re-opened (S5) and goes back for verification (S3). Once verified, it is Closed (S4). NEW QUESTION # 78

Which of the following is not an example of a typical content of a test completion report for a test project?

- A. The residual risk level if a risk-based test approach was adopted
- B. The additional effort spent on test execution compared to what was planned
- C. The test procedures of all test cases that have been executed
- D. The unexpected test environment downtime that resulted in slower test execution

Answer: C

Explanation:

Explanation

This answer is correct because the test procedures of all test cases that have been executed are not a typical content of a test completion report for a test project. A test completion report is a document that summarizes the test activities and results at the end of a test project. It usually includes information such as the test objectives, scope, approach, resources, schedule, results, deviations, issues, risks, lessons learned, and recommendations for improvement. The test procedures of all test cases that have been executed are part of the test documentation, but they are not relevant for the test completion report, as they do not provide a high-level overview of the test project outcomes and performance. NEW QUESTION # 79

Which ONE of the following options BEST describes a key characteristic of non-functional testing?

- A. Conducting non-functional testing exclusively at the acceptance test level.

- B. Limiting non-functional testing to security testing and performance testing only.
- C. Ensuring non-functional testing focuses only on user experience and usability.
- D. Performing non-functional testing starting at the system test level.

Answer: D

Explanation:

Non-functional testing evaluates attributes like performance, security, and usability, which are typically assessed at the system test level or higher (A). It is not restricted to acceptance testing (B), goes beyond security and performance testing (C), and covers more than just user experience (D).

Reference: ISTQB CTFL v4.0 Syllabus, Section 2.2.2 - Non-functional Testing

NEW QUESTION # 80

Which of the following statements about the value of maintaining traceability between the test basis and test work products is not true?

- A. Traceability can be useful for determining the most suitable test techniques to be used in a testing project
- B. Traceability can be useful for determining how many test basis items are covered by the corresponding tests
- C. Traceability can be useful for assessing the impact of a change to a test basis item on the corresponding tests
- D. Traceability can be useful to support the needs required by the auditing of testing

Answer: A

Explanation:

Explanation

Traceability is the ability to trace the relationships between the items of the test basis, such as the requirements, the design, the risks, etc., and the test artifacts, such as the test cases, the test results, the defects, etc. Traceability can provide various benefits for the testing process, such as improving the test coverage, the test quality, the test efficiency, and the test communication. However, not all the statements given are true about the value of maintaining traceability between the test basis and test work products. The statement that is not true is option C, which says that test objectives should be the same for all test levels, although the number of tests designed at various levels can vary significantly. This statement is false, because test objectives are the goals or the purposes of testing, which can vary depending on the test level, the test type, the test technique, the test environment, the test stakeholder, etc. Test objectives can be defined in terms of the test basis, the test coverage, the test quality, the test risk, the test cost, the test time, etc. Test objectives should be specific, measurable, achievable, relevant, and time-bound, and they should be aligned with the project objectives and the quality characteristics. Test objectives should not be the same for all test levels, as different test levels have different focuses, scopes, and perspectives of testing, such as component testing, integration testing, system testing, and acceptance testing. The other statements are true about the value of maintaining traceability between the test basis and test work products, such as:

Traceability can be useful for assessing the impact of a change to a test basis item on the corresponding tests: This statement is true, because traceability can help to identify which tests are affected by a change in the test basis, such as a new requirement, a modified design, a revised risk, etc., and to determine the necessary actions to update, re-execute, or re-evaluate the tests. Traceability can also help to estimate the effort, the cost, and the time needed to implement the change and to verify its impact on the software system.

Traceability can be useful for determining how many test basis items are covered by the corresponding tests: This statement is true, because traceability can help to measure the test coverage, which is the degree to which the test basis is exercised by the test cases. Traceability can help to identify which test basis items are covered, partially covered, or not covered by the tests, and to evaluate the adequacy, the completeness, and the effectiveness of the testing process. Traceability can also help to identify the gaps, the overlaps, or the redundancies in the test coverage, and to prioritize, optimize, or improve the test cases.

Traceability can be useful to support the needs required by the auditing of testing: This statement is true, because traceability can help to provide evidence, documentation, and justification for the testing activities, results, and outcomes. Traceability can help to demonstrate that the testing process follows the standards, the regulations, the policies, and the best practices that are applicable to the software system, the project, or the organization. Traceability can also help to verify that the testing process meets the expectations, the needs, and the satisfaction of the users and the stakeholders. NEW QUESTION # 81

Which of the following is the main difference between quality assurance (QA) and quality control (QC)?

- A. QA is the responsibility of everyone on a project, while QC is the responsibility of a dedicated team.
- B. QA is focused on implementation, while QC is focused on improvement.
- C. QA is preventive, while QC is corrective.
- **D. QA is a process-oriented approach, while QC is a product-oriented approach.**

Answer: D

Explanation:

Quality Assurance (QA) and Quality Control (QC) are both essential aspects of a comprehensive quality management system but they serve different purposes:

* Quality Assurance (QA): QA is a process-oriented approach that focuses on preventing defects by improving the processes used to develop and test products. It involves setting up processes, methodologies, and standards to ensure that the product meets quality requirements.

* Quality Control (QC): QC is a product-oriented approach that focuses on identifying defects in the final products. It involves activities such as inspection, testing, and review to ensure that the product meets the specified requirements and standards.

Thus, the main difference is that QA is process-oriented and preventive, while QC is product-oriented and corrective.
