Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q177-Q182):

NEW QUESTION # 177

A company wants to experiment with individual AWS accounts for its engineer team. The company wants to be notified as soon as the Amazon EC2 instance usage for a given month exceeds a specific threshold for each account.

What should a solutions architect do to meet this requirement MOST cost-effectively?

- A. Use Cost Explorer to create a daily report of costs by service. Filter the report by EC2 instances. Configure Cost Explorer to send an Amazon Simple Email Service (Amazon SES) notification when a threshold is exceeded.
- B. Use Cost Explorer to create a monthly report of costs by service. Filter the report by EC2 instances. Configure Cost Explorer to send an Amazon Simple Email Service (Amazon SES) notification when a threshold is exceeded.
- C. Use AWS Cost and Usage Reports to create a report with hourly granularity. Integrate the report data with Amazon Athena. Use Amazon EventBridge to schedule an Athena query. Configure an Amazon Simple Notification Service (Amazon SNS) topic to receive a notification when a threshold is exceeded.
- **D. Use AWS Budgets to create a cost budget for each account. Set the period to monthly. Set the scope to EC2 instances. Set an alert threshold for the budget. Configure an Amazon Simple Notification Service (Amazon SNS) topic to receive a notification when a threshold is exceeded.**

Answer: D

Explanation:

AWS Budgets allows you to create budgets for your AWS accounts and set alerts when usage exceeds a certain threshold. By creating a budget for each account, specifying the period as monthly and the scope as EC2 instances, you can effectively track the EC2 usage for each account and be notified when a threshold is exceeded. This solution is the most cost-effective option as it does not require additional resources such as Amazon Athena or Amazon EventBridge.

NEW QUESTION # 178

A company uses Amazon S3 to store customer data that contains personally identifiable information (PII) attributes. The company needs to make the customer information available to company resources through an AWS Glue Catalog. The company needs to have fine-grained access control for the data so that only specific IAM roles can access the PII data.

- **A. Use AWS Lake Formation to provide the specified IAM roles access to the PII data.**
- B. Create one IAM role that grants access to PII. Create a second IAM role that grants access to non-PII data. Assign the PII policy to the specified IAM roles.
- C. Create one IAM policy that grants access to PII. Create a second IAM policy that grants access to non- PII data. Assign the PII policy to the specified IAM roles.
- D. Use AWS Glue to create one view for PII data. Create a second view for non-PII data. Provide the specified IAM roles access to the PII view.

Answer: A

Explanation:

AWS Lake Formation is designed for managing fine-grained access control to data in an efficient manner:

- * Granular Permissions: Lake Formation allows column-level, row-level, and table-level access controls, which can precisely define access to PII data.

- * Integration with AWS Glue Catalog: Lake Formation natively integrates with AWS Glue for seamless data cataloging and access control.

- * Operational Efficiency: Centralized access control policies minimize the need for separate IAM roles or policies.

Why Other Options Are Not Ideal:

- * Option A:

- * Creating multiple IAM policies introduces complexity and lacks column-level access control. Not efficient.

- * Option B:

- * Managing multiple IAM roles for granular access is operationally complex. Not efficient.

- * Option D:

- * Creating views in Glue adds unnecessary complexity and may not provide the level of granularity that Lake Formation offers. Not the best choice.

NEW QUESTION # 179

An online retail company has more than 50 million active customers and receives more than 25,000 orders each day. The company collects purchase data for customers and stores this data in Amazon S3. Additional customer data is stored in Amazon RDS.

The company wants to make all the data available to various teams so that the teams can perform analytics.

The solution must provide the ability to manage fine-grained permissions for the data and must minimize operational overhead.

Which solution will meet these requirements?

- A. Create an Amazon Redshift cluster. Schedule an AWS Lambda function to periodically copy data from Amazon S3 and Amazon RDS to Amazon Redshift. Use Amazon Redshift access controls to limit access.
- B. Schedule an AWS Lambda function to periodically copy data from Amazon RDS to Amazon S3. Create an AWS Glue crawler. Use Amazon Athena to query the data. Use S3 policies to limit access.
- **C. Create a data lake by using AWS Lake Formation. Create an AWS Glue JDBC connection to Amazon RDS. Register the S3 bucket in Lake Formation. Use Lake Formation access controls to limit access.**
- D. Migrate the purchase data to write directly to Amazon RDS. Use RDS access controls to limit access.

Answer: C

Explanation:

Explanation

To make all the data available to various teams and minimize operational overhead, the company can create a data lake by using AWS Lake Formation. This will allow the company to centralize all the data in one place and use fine-grained access controls to manage access to the data. To meet the requirements of the company, the solutions architect can create a data lake by using AWS Lake Formation, create an AWS Glue JDBC connection to Amazon RDS, and register the S3 bucket in Lake Formation. The solutions architect can then use Lake Formation access controls to limit access to the data. This solution will provide the ability to manage fine-grained permissions for the data and minimize operational overhead.

NEW QUESTION # 180

A solutions architect is creating a new VPC design. There are two public subnets for the load balancer, two private subnets for web servers, and two private subnets for MySQL. The web servers use only HTTPS. The solutions architect has already created a security group for the load balancer allowing port 443 from 0.0.0.0/0. Company policy requires that each resource has the least access required to still be able to perform its tasks. Which additional configuration strategy should the solutions architect use to meet these requirements?

- A. Create a network ACL for the web servers and allow port 443 from the load balancer. Create a network ACL for the MySQL servers and allow port 3306 from the web servers security group.
- B. Create a security group for the web servers and allow port 443 from 0.0.0.0/0. Create a security group for the MySQL servers and allow port 3306 from the web servers security group.
- **C. Create a security group for the web servers and allow port 443 from the load balancer. Create a security group for the MySQL servers and allow port 3306 from the web servers security group.**

- D. Create a network ACL for the web servers and allow port 443 from 0.0.0.0/0 Create a network ACL (or the MySQL servers and allow port 3306 from the web servers security group

Answer: C

Explanation:

Explanation

This answer is correct because it provides a resilient and durable replacement for the on-premises file share that is compatible with Windows IIS web servers. Amazon FSx for Windows File Server is a fully managed service that provides shared file storage built on Windows Server. It supports the SMB protocol and integrates with Microsoft Active Directory, which enables seamless access and authentication for Windows-based applications. Amazon FSx for Windows File Server also offers the following benefits:

* **Resilience:** Amazon FSx for Windows File Server can be deployed in multiple Availability Zones, which provides high availability and failover protection. It also supports automatic backups and restores, as well as self-healing features that detect and correct issues.

* **Durability:** Amazon FSx for Windows File Server replicates data within and across Availability Zones, and stores data on highly durable storage devices. It also supports encryption at rest and in transit, as well as file access auditing and data deduplication.

* **Performance:** Amazon FSx for Windows File Server delivers consistent sub-millisecond latencies and high throughput for file operations. It also supports SSD storage, native Windows features such as Distributed File System (DFS) Namespaces and Replication, and user-driven performance scaling.

By configuring the Amazon FSx file share to use an AWS KMS CMK to encrypt the images in the file share, the company can protect the images from unauthorized access and comply with company policy. By using NTFS permission sets on the images, the company can prevent accidental deletion of the images by restricting who can modify or delete them.

NEW QUESTION # 181

A company is creating a low-latency payment processing application that supports TLS connections from IPv4 clients. The application requires outbound access to the public internet. Users must access the application from a single entry point. The bank wants to use Amazon Elastic Container Service (Amazon ECS) tasks to deploy the application. The company wants to enable AWSVPC network mode.

Which solution will meet these requirements MOST securely?

- **A. Create a VPC that has an internet gateway, public subnets, and private subnets. Deploy a Network Load Balancer and a NAT gateway in the public subnets. Deploy the ECS tasks in the private subnets.**
- B. Create a VPC that has an outbound-only internet gateway, public subnets, and private subnets. Deploy an Application Load Balancer and a NAT gateway in the public subnets. Deploy the ECS tasks in the private subnets.
- C. Create a VPC that has an outbound-only internet gateway, public subnets, and private subnets. Deploy a Network Load Balancer in the public subnets. Deploy the ECS tasks in the public subnets.
- D. Create a VPC that has an internet gateway, public subnets, and private subnets. Deploy an Application Load Balancer in the public subnets. Deploy the ECS tasks in the public subnets.

Answer: A
