Linux Foundation Certified GitOps Associate Sample Questions (Q60-Q65):

NEW QUESTION # 60
You are working on a GitOps deployment and want to manage the configuration of your Kubernetes resources across multiple environments. How does Kustomize help?

- A. Kustomize helps you create and manage Kubernetes resource manifests by providing a graphical user interface (GUI).
- B. Kustomize helps you create and manage Kubernetes resource manifests by providing a way to customize them through patching.
- C. Kustomize is a tool for deploying infrastructure resources using Terraform/OpenTofu.
- D. Kustomize allows you to package and distribute your application as a Helm chart.

Answer: B

Explanation:
Kustomize is a Kubernetes-native configuration management tool that allows manifest customization without modifying the original YAML files. It uses overlays and patches to adapt configurations for different environments.
"Kustomize provides a declarative way to customize Kubernetes manifests by applying patches and overlays.
This allows managing multiple environments without duplicating manifest files." Thus, the correct answer is D.

NEW QUESTION # 61
You are implementing GitOps in your organization and have configured the Desired State of your applications in a Git repository. However, during the deployment process, you encounter an error in the configuration. What is the recommended action in this scenario?

- A. Make a call to the Kubernetes API with the correction.
- B. Roll back the deployment to the previous working version while investigating the error in the configuration file.
- C. Continue to monitor the issue and proceed with the deployment, as it may not significantly impact the application.
- D. Raise a ticket with the development team to fix the error in the configuration file.

Answer: B

Explanation:
GitOps emphasizes immutability and auditability. If an error occurs in the configuration stored in Git, the system should be rolled back to the last known good state while the error is fixed. This preserves system reliability and aligns with the GitOps principle of rollback through version control.
"With Git as the source of truth, if an error is introduced, the system can be rolled back by reverting to a previous commit. This ensures stability while the faulty configuration is corrected." Thus, the recommended action is C: Roll back to the previous working version.

NEW QUESTION # 62
In the context of GitOps, what doesContinuousmean?

- A. Reconciliation must happen instantaneously.
- B. Reconciliation only happens once.
- C. Reconciliation happens only during instantiation.
- D. Reconciliation continues to happen.

Answer: D

Explanation:
One of the four core GitOps principles is that the system must beContinuously Reconciled. This means reconciliation is not a one-time or on-demand process but happensconstantlyin the background, ensuring the actual system state remains aligned with the declared desired state.
"GitOps requires that reconciliation is continuous. Software agents continuously compare actual state against desired state and automatically reconcile differences." Thus, the correct answer isC.

NEW QUESTION # 63
In the context of GitOps, why would you do a rollback?

- A. To test a new feature in a controlled environment.
- B. To create a backup of the current configuration.
- C. To improve performance and optimize resource utilization.
- D. To undo a deployment that introduced a critical bug or caused a system failure.

Answer: D

Explanation:
In GitOps, rollback is the process of reverting to a previous known-good configuration stored in Git. This is typically done when a deployment introduces abug, error, or failurethat impacts system stability.
"Rollback in GitOps is used to revert to a previous commit representing a stable configuration when the current deployment causes errors or failures." Thus, the correct answer isA.

NEW QUESTION # 64
You are working on a GitOps project and want to trigger a reconcile process before the next scheduled reconciliation. What is the recommended way to do this?

- A. Use a webhook to trigger the reconcile process based on events or changes in the Git repository.
- B. Schedule a cron job to run the reconcile process periodically, using RBAC to authenticate.
- C. Manually execute a script to initiate the reconcile process on the cluster using GitOps tool CLI commands.
- D. Adjust the reconcile process interval time.

Answer: A

Explanation:
Although reconciliation is continuous in GitOps, tools often allow reconciliation to be triggered earlier than the normal polling interval. The recommended approach is to usewebhooks from the Git repository, which notify the GitOps controller of changes and trigger an immediate reconcile.
"While reconciliation loops continuously compare desired and actual state, reconciliation can be triggered sooner by webhooks from version control events, ensuring timely application of changes." Thus, the correct answer isA.
