Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q14-Q19):

NEW QUESTION # 14

Refer to the exhibit.

Your organization is planning the implementation of a complex hub-to-spoke solution to meet automated large-scale branch connectivity with multiple regions, offering a diverse range of connectivity options. Which Azure networking service can deliver a solution?

- A. Azure Virtual WAN
- B. Azure VPN Gateway
- C. Azure Firewall Manager
- D. Azure SD-WAN

Answer: A

Explanation:

Azure Virtual WAN is designed for large-scale, automated, and global branch connectivity, supporting hub-and-spoke architectures across multiple regions. It enables centralized routing, hub-to-hub connectivity, and integrates with VPN, ExpressRoute, and SD-WAN solutions, making it ideal for complex, multi-region deployments as shown in the diagram.

NEW QUESTION # 15

In the context of Azure Route Server, what is a primary function of the route server subnet?

- A. Serving as the hub for the exchange of routing information
- B. Acting as a dedicated subnet to host network virtual appliances (NVAs) with routing propagation capabilities
- C. Hosting virtual machines for routing propagation purposes
- D. Providing DNS resolution for on-premises networks

Answer: A

Explanation:

The route server subnet in Azure is a dedicated subnet that hosts the Azure Route Server, which functions as the hub for dynamic routing information exchange between Azure virtual networks and BGP-enabled network virtual appliances (NVAs) or on-premises routers. It enables seamless and centralized route propagation.

NEW QUESTION # 16

What are two characteristics of Azure standard public IP addresses? (Choose two.)

- A. They can be used with load balancers of any SKU
- B. They require the configuration of NSGs for inbound traffic

- C. They can be dynamic or static
- D. They support the use of availability zones

Answer: C,D

Explanation:

They support the use of availability zones - Standard public IP addresses are zone-redundant and support availability zone deployments for high availability.

They can be dynamic or static - Azure standard public IPs can be configured as static or dynamic, offering flexibility based on deployment needs.

NEW QUESTION # 17

After integrating a FortiGate VM with Azure Route Server, you detect that routes are not propagating successfully.

What initial step could you perform to diagnose the root cause?

- A. Verify that the FortiGate VM is running the latest firmware version
- B. Monitor the network latency between the FortiGate VM and Azure Route Server to identify potential communication delays affecting route propagation
- C. Verify the BGP peering status on both the FortiGate VM and Azure Route Server
- D. Examine the Azure Microsoft Entra ID permissions associated with the FortiGate VM to ensure that correct authentication is being used for BGP peering

Answer: C

Explanation:

The first and most direct diagnostic step is to verify the BGP peering status on both the FortiGate VM and Azure Route Server. If BGP peering is not established or is in an idle or down state, route propagation will fail. This check confirms whether the two systems are communicating and exchanging routes as expected.

NEW QUESTION # 18

What is a limitation of the Network Security Groups (NSGs) in Azure?

- A. NSGs operate at the application layer, limiting their effectiveness in the network layer.
- B. NSGs allow the filtering of inbound traffic only.
- C. NSGs cannot be applied to individual virtual machines.
- D. NSGs are applied only to vNICs.

Answer: D

Explanation:

A limitation of NSGs is that they are applied only at the subnet level or to network interfaces (vNICs), not directly to other resources like load balancers or application gateways. This means granular application-layer filtering is not supported, and NSGs primarily operate at Layers 3 and 4.
