PCEP-30-02 New Dumps Free, Sample PCEP-30-02 Questions Answers

No doubt Python Institute PCEP-30-02 exam practice test questions are the recommended PCEP - Certified Entry-Level Python Programmer PCEP-30-02 exam preparation resources that make the Python Institute PCEP-30-02 exam preparation simple and easiest. To do this you need to download updated and real PCEP-30-02 exam questions which you can get from the Actualtests4sure platform easily. At the Actualtests4sure you can easily download valid, updated, and real PCEP-30-02 Exam Practice questions. All these Python Institute PCEP-30-02 PDF Dumps are verified and recommended by qualified Python Institute PCEP-30-02 exam trainers. So you rest assured that with the Python Institute PCEP-30-02 exam real questions you will get everything that you need to prepare, learn and pass the difficult Python Institute PCEP-30-02 exam with confidence.

If you want to clear Python Institute real exams but doubt to us, you can download the free demo of PCEP-30-02 dumps pdf to check. We will provide the one-year free update once you purchase our PCEP-30-02 Practice Questions. I will give you my support if you have any problems and doubts when you learn the Python Institute PCEP study materials.

Sample PCEP-30-02 Questions Answers | Reliable PCEP-30-02 Test Experience

The design of our PCEP-30-02 guide training is ingenious and delicate. Every detail is perfect. For example, if you choose to study our PCEP-30-02 learning materials on our windows software, you will find the interface our PCEP-30-02 earning materials are concise and beautiful, so it can allow you to study PCEP-30-02 Exam Questions in a concise and undisturbed environment. In addition, you will find a lot of small buttons, which can give you a lot of help. If you are satisfied with our PCEP-30-02 exam questions, you can make a choice to purchase them.

Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q10-Q15):

NEW QUESTION # 10
Insert the code boxes in the correct positions in order to build a line of code which asks the user for an integer value and assigns it to the depth variable.
(Note: some code boxes will not be used.)

Answer:

Explanation:

Explanation:

One possible way to insert the code boxes in the correct positions in order to build a line of code which asks the user for an integer value and assigns it to the depth variable is:

depth = int(input("Enter the immersion depth: "))

This line of code uses the input function to prompt the user for a string value, and then uses the int function to convert that string value into an integer number. The result is then assigned to the variable depth.

You can find more information about the input and int functions in Python in the following references:

* [Python input() Function]
* [Python int() Function]

NEW QUESTION # 11

Arrange the code boxes in the correct positions to form a conditional instruction which guarantees that a certain statement is executed when the speed variable is less than 50.0.

Answer:

Explanation:

Explanation:

One possible way to arrange the code boxes in the correct positions to form a conditional instruction which guarantees that a certain statement is executed when the speed variable is less than 50.0 is:
if speed < 50.0:

print("The speed is low.")

This code uses the if keyword to create a conditional statement that checks the value of the variable speed. If the value is less than 50.0, then the code will print "The speed is low." to the screen. The print function is used to display the output. The code is indented to show the block of code that belongs to the if condition.

You can find more information about the if statement and the print function in Python in the following references:

* Python If ... Else
* Python Print Function

NEW QUESTION # 12

Which of the following expressions evaluate to a non-zero result? (Select two answers.)

- A. $1 * 4 // 2 ** 3$
- B. $4 / 2 ** 3 - 2$
- C. $1 ** 3 / 4 - 1$
- D. $2 ** 3 / A - 2$

Answer: B,D

Explanation:

Explanation

In Python, the ** operator is used for exponentiation, the / operator is used for floating-point division, and the
// operator is used for integer division. The order of operations is parentheses, exponentiation, multiplication/division, and addition/subtraction. Therefore, the expressions can be evaluated as follows:

A). $2 ** 3 / A - 2 = 8 / A - 2$ (assuming A is a variable that is not zero or undefined)
B). $4 / 2 ** 3 - 2 = 4 / 8 - 2 = 0.5 - 2 = -1.5$ C. $1 ** 3 / 4 - 1 = 1 / 4 - 1 = 0.25 - 1 = -0.75$ D. $1 * 4 // 2 ** 3 = 4 // 8 = 0$ Only expressions A and B evaluate to non-zero results.

NEW QUESTION # 13

What is the expected output of the following code?

```
def runner(brand, model, year=2022, convertible=False):
    return (brand, str(year), str(convertible))

print(runner(model = "Prius", brand = "Ampere")[1][1])
```

- A. The code raises an unhandled exception.
- B. ('Ampere*. '2021', 'False')
- C. 0
- D. 1

Answer: D

NEW QUESTION # 14

Which of the following are the names of Python passing argument styles?
(Select two answers.)

- A. reference
- B. indicatory
- C. positional
- D. keyword

Answer: C,D

Explanation:
Explanation
Keyword arguments are arguments that are specified by using the name of the parameter, followed by an equal sign and the value of the argument. For example, print (sep='-', end='!') is a function call with keyword arguments. Keyword arguments can be used to pass arguments in any order, and to provide default values for some arguments1.
Positional arguments are arguments that are passed in the same order as the parameters of the function definition. For example, print ('Hello', 'World') is a function call with positional arguments. Positional arguments must be passed before any keyword arguments, and they must match the number and type of the parameters of the function2.
