PCEP - Certified Entry-Level Python Programmer actual exam torrent & PCEP-30-02 dumps will facilitate exam success

What's more, part of that iPassleader PCEP-30-02 dumps now are free: https://drive.google.com/open?id=1vQ9L2UAqr996b9TOqzWIvCQBX7Tg2xER

By practicing under the real exam scenario of this Python Institute PCEP-30-02 web-based practice test, you can cope with exam anxiety and appear in the final test with maximum confidence. You can change the time limit and number of questions of this Python Institute PCEP-30-02 web-based practice test. This customization feature of our PCEP - Certified Entry-Level Python Programmer (PCEP-30-02) web-based practice exam aids in practicing as per your requirements. You can assess and improve your knowledge with our Python Institute PCEP-30-02 practice exam.

Python Institute PCEP-30-02 Exam Syllabus Topics:

Topic	Details
Topic 1	• Functions and Exceptions: This part of the exam covers the definition of function and invocation
Topic 2	• Loops: while, for, range(), loops control, and nesting of loops.
Topic 3	• Data Collections: In this section, the focus is on list construction, indexing, slicing, methods, and comprehensions; it covers Tuples, Dictionaries, and Strings.
Topic 4	• Control Flow: This section covers conditional statements such as if, if-else, if-elif, if-elif-else
Topic 5	• Computer Programming Fundamentals: This section of the exam covers fundamental concepts such as interpreters, compilers, syntax, and semantics. It covers Python basics: keywords, instructions, indentation, comments in addition to Booleans, integers, floats, strings, and Variables, and naming conventions. Finally, it covers arithmetic, string, assignment, bitwise, Boolean, relational, and Input • output operations.

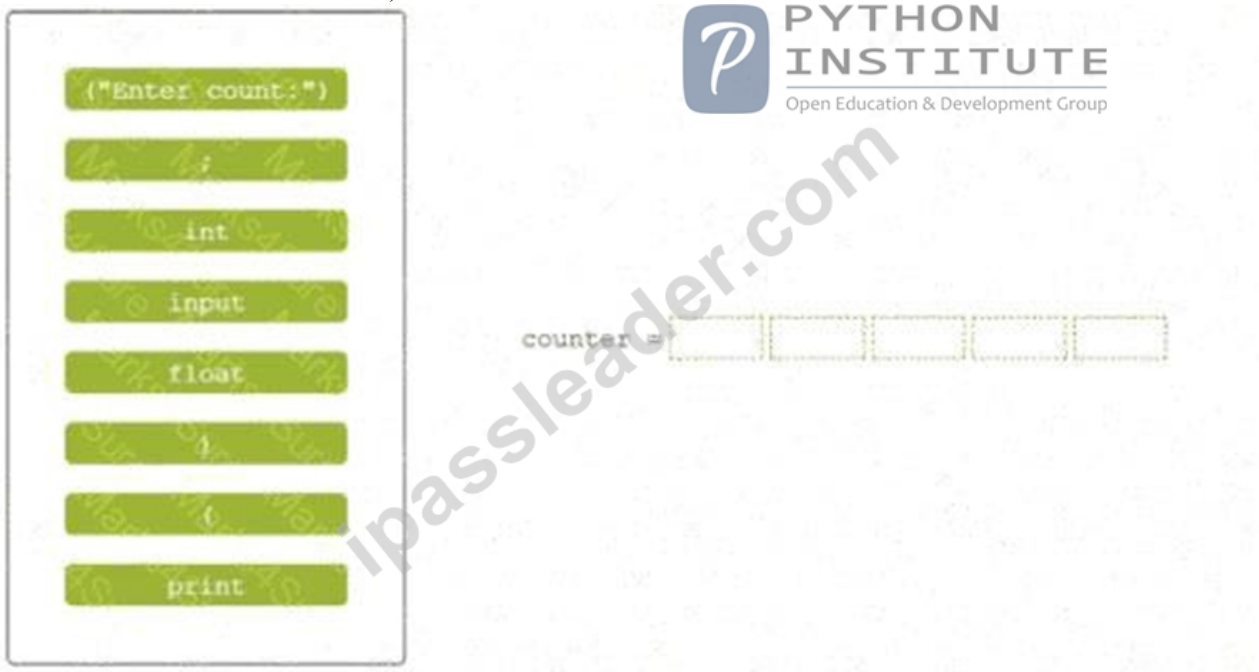
Reliable PCEP-30-02 Exam Tips | Reliable PCEP-30-02 Test Online

If you encounter any questions about our PCEP-30-02 learning materials during use, you can contact our staff and we will be happy to serve for you. Maybe you will ask if we will charge an extra service fee. We assure you that we are committed to providing you with guidance on PCEP-30-02 quiz torrent, but all services are free of charge. As for any of your suggestions, we will take it into consideration, and effectively improve our PCEP-30-02 Exam Question to better meet the needs of clients. In the process of your study, we have always been behind you and are your solid backing. This will ensure that once you have any questions you can get

help in a timely manner.

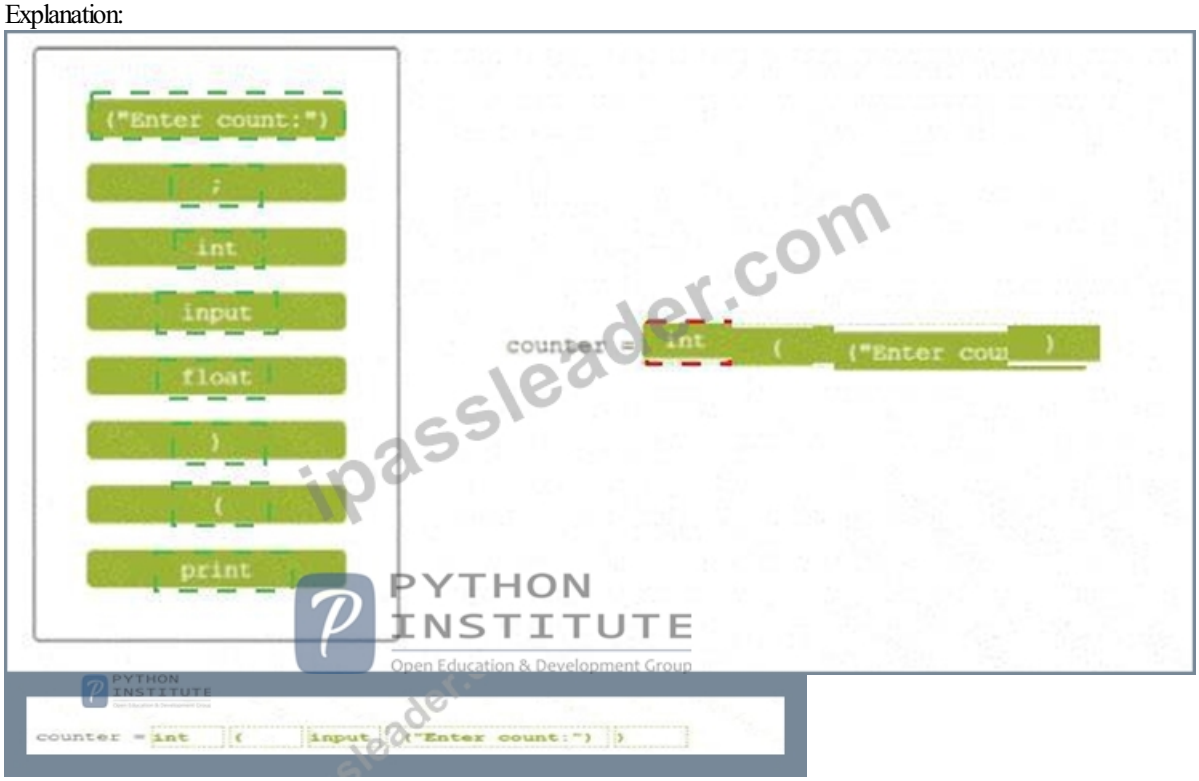
Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q34-Q39):

NEW QUESTION # 34
Insert the code boxes in the correct positions in order to build a line of code which asks the user for an Integer value and assigns it to the counter variable.
(Note: some code boxes will not be used.)

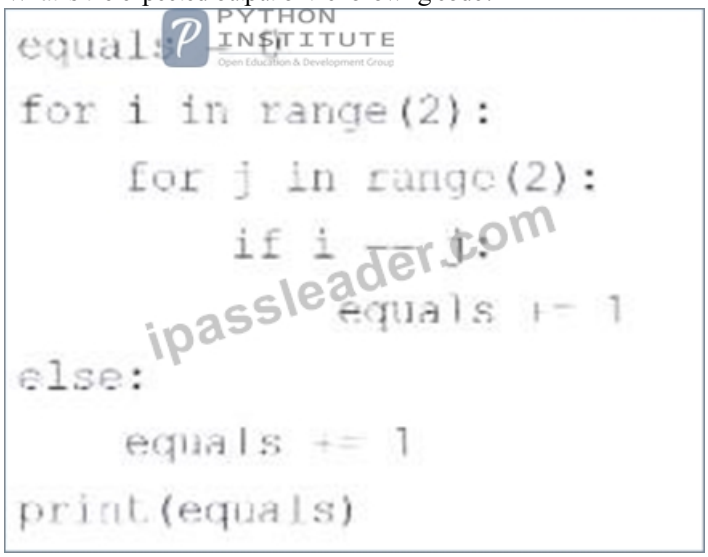


Answer:

Explanation:



NEW QUESTION # 35
What is the expected output of the following code?



- A. 0
- B. 1
- C. The code outputs nothing.
- D. 2

Answer: D

Explanation:
The code snippet that you have sent is checking if two numbers are equal and printing the result. The code is as follows:
num1 = 1 num2 = 2 if num1 == num2: print(4) else: print(1)
The code starts with assigning the values 1 and 2 to the variables "num1" and "num2" respectively. Then, it enters an if statement that compares the values of "num1" and "num2" using the equality operator (==). If the values are equal, the code prints 4 to the screen. If the values are not equal, the code prints 1 to the screen.
The expected output of the code is 1, because the values of "num1" and "num2" are not equal. Therefore, the correct answer is C. 1.
Reference: [Python Institute - Entry-Level Python Programmer Certification]

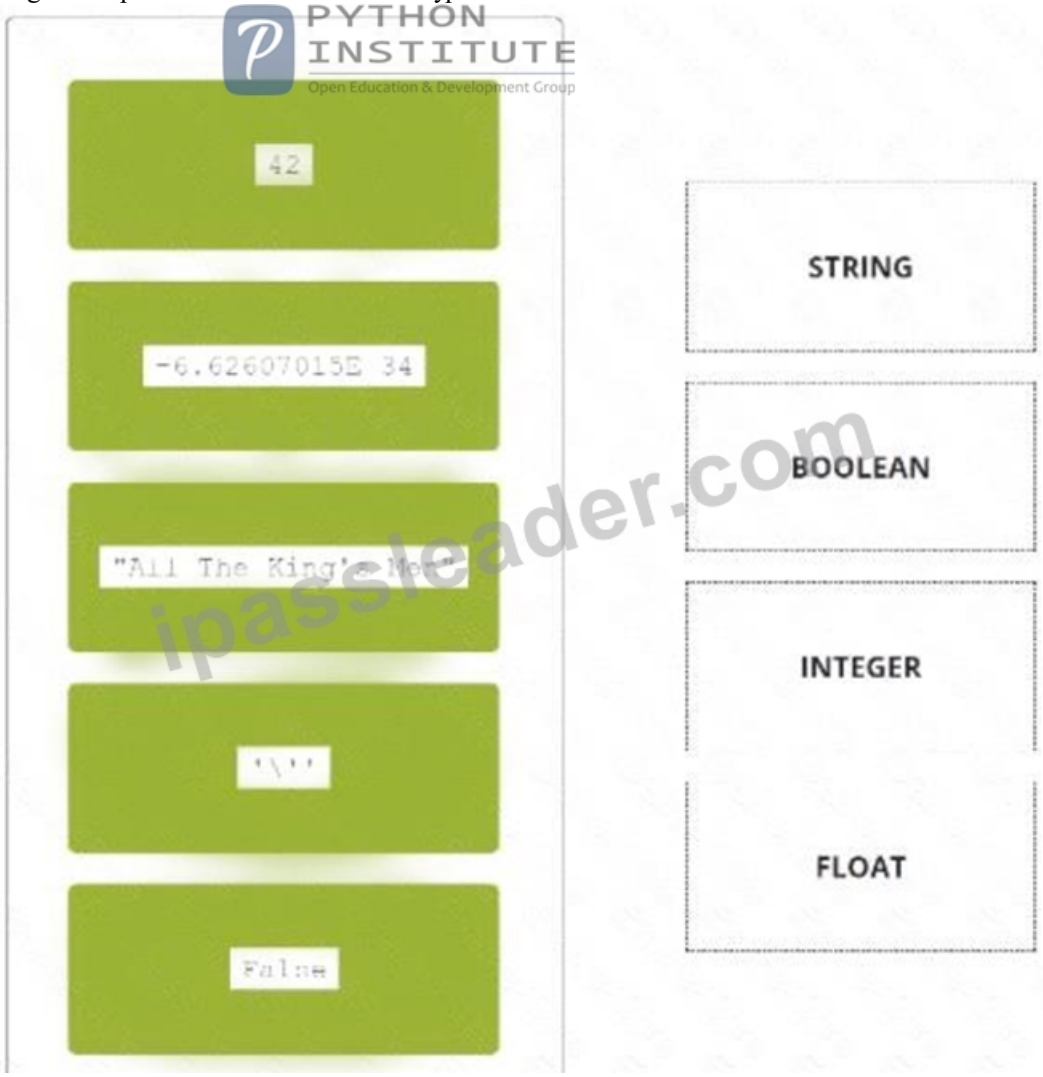
NEW QUESTION # 36
What is the expected output of the following code?

- A. The code produces no output.
- B. *
- C. * * *
- D. * *

Answer: D

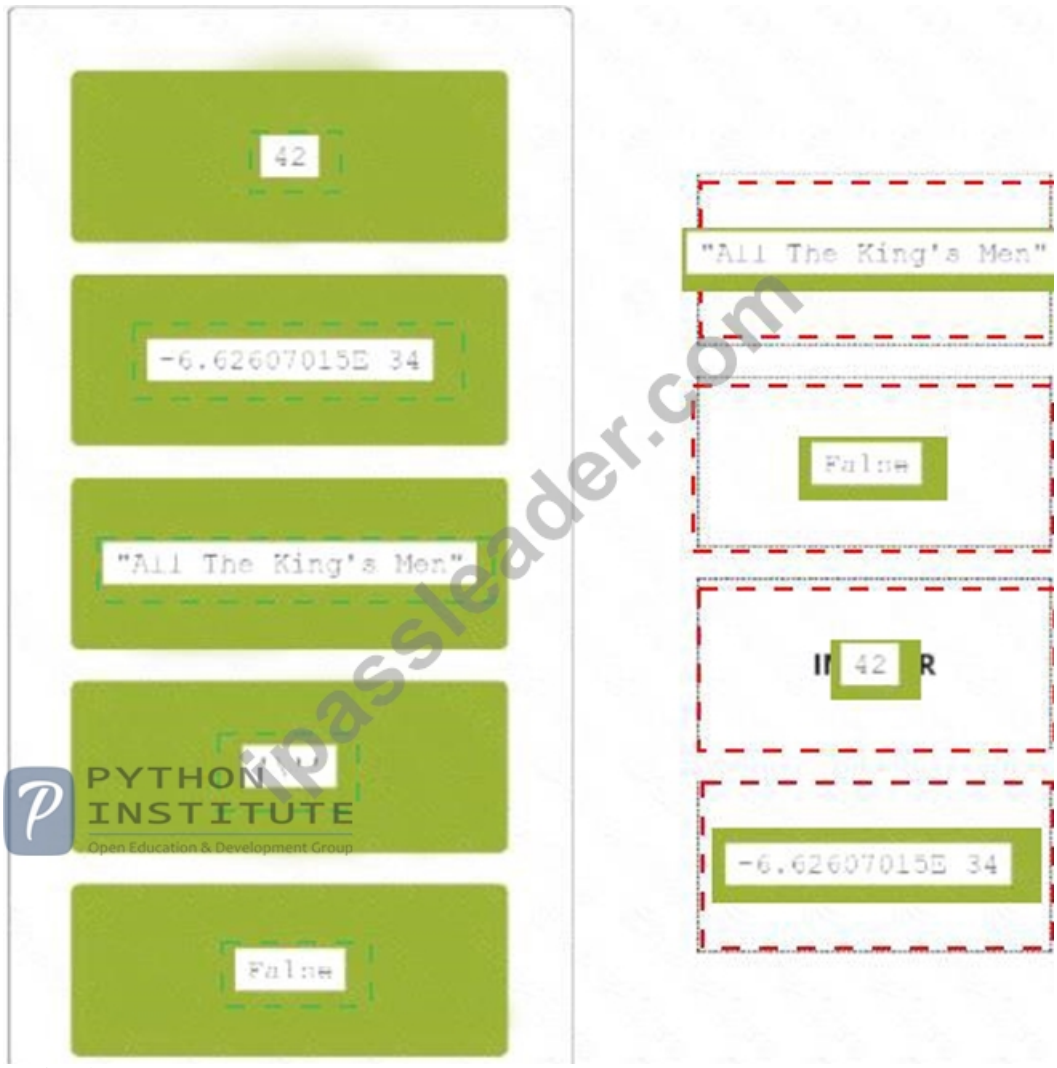
Explanation:
Explanation
The code snippet that you have sent is a conditional statement that checks if a variable "counter" is less than 0, greater than or equal to 42, or neither. The code is as follows:
if counter < 0: print("") elif counter >= 42: print("") else: print("") The code starts with checking if the value of "counter" is less than 0. If yes, it prints a single asterisk () to the screen and exits the statement. If no, it checks if the value of "counter" is greater than or equal to 42. If yes, it prints three asterisks () to the screen and exits the statement. If no, it prints two asterisks () to the screen and exits the statement.
The expected output of the code depends on the value of "counter". If the value of "counter" is 10, as shown in the image, the code will print two asterisks (**) to the screen, because 10 is neither less than 0 nor greater than or equal to 42. Therefore, the correct answer is C. * *

NEW QUESTION # 37
Drag and drop the literals to match their data type names.



Answer:

Explanation:



Explanation
One possible way to drag and drop the literals to match their data type names is:
STRING: "All The King's Men"
BOOLEAN: False
INTEGER: 42
FLOAT: -6.62607015E-34
A literal is a value that is written exactly as it is meant to be interpreted by the Python interpreter. A data type is a category of values that share some common characteristics or operations. Python has four basic data types:
string, boolean, integer, and float.
A string is a sequence of characters enclosed by either single or double quotes. A string can represent text, symbols, or any other information that can be displayed as text. For example, "All The King's Men" is a string literal that represents the title of a novel.
A boolean is a logical value that can be either True or False. A boolean can represent the result of a comparison, a condition, or a logical operation. For example, False is a boolean literal that represents the opposite of True.
An integer is a whole number that can be positive, negative, or zero. An integer can represent a count, an index, or any other quantity that does not require fractions or decimals. For example, 42 is an integer literal that represents the answer to life, the universe, and everything.
A float is a number that can have a fractional part after the decimal point. A float can represent a measurement, a ratio, or any other quantity that requires precision or approximation. For example,
-6.62607015E-34 is a float literal that represents the Planck constant in scientific notation.
You can find more information about the literals and data types in Python in the following references:
[Python Data Types]
[Python Literals]
[Python Basic Syntax]

NEW QUESTION # 38
What is the expected output of the following code?

- A. 0
- B. The code is erroneous and cannot be run.
- C. ppt
- D. pizzapastafolpetti

Answer: C

Explanation:
The code snippet that you have sent is using the slicing operation to get parts of a string and concatenate them together. The code is as follows:
pizza = "pizza" pasta = "pasta" folpetti = "folpetti" print(pizza[0] + pasta[0] + folpetti[0]) The code starts with assigning the strings "pizza", "pasta", and "folpetti" to the variables pizza, pasta, and folpetti respectively. Then, it uses the print function to display the result of concatenating the first characters of each string. The first character of a string can be accessed by using the index 0 inside square brackets. For example, pizza[0] returns "p". The concatenation operation is used to join two or more strings together by using the + operator. For example, "a" + "b" returns "ab". The code prints the result of pizza[0] + pasta[0] + folpetti[0], which is "p" + "p" + "f", which is "ppt".
The expected output of the code is ppt, because the code prints the first characters of each string. Therefore, the correct answer is B. ppt.
