ISACA Advanced in AI Security Management (AAISM) Exam Sample Questions (Q26-Q31):

NEW QUESTION # 26

Which of the following AI-driven systems should have the MOST stringent recovery time objective (RTO)?

- A. Health support system
- B. Car navigation system
- C. Credit risk modeling system

- **D. Industrial control system**

Answer: D

Explanation:

AAISM risk guidance notes that the most stringent recovery objectives apply to industrial control systems, as downtime can directly disrupt critical infrastructure, manufacturing, or safety operations. Health support systems also require high availability, but industrial control often underpins safety-critical and real-time environments where delays can result in catastrophic outcomes. Credit risk models and navigation systems are important but less critical in terms of immediate physical and operational impact. Thus, industrial control systems require the tightest RTO.

NEW QUESTION # 27

Which of the following is the MOST effective use of AI-enabled tools in a security operations center (SOC)?

- **A. Employing AI-enabled tools to reduce false negatives by detecting subtle attack patterns**
- B. Using AI-enabled tools exclusively to classify all types of security incidents
- C. Assigning AI-enabled tools to triage non-critical alerts to preserve SOC resources
- D. Replacing human analysis with automated AI decision-making processes

Answer: A

Explanation:

The most effective SOC application of AI is in detecting subtle, hard-to-find attack patterns that reduce false negatives.

AAISM technical control guidance notes that AI in SOC's is best applied to:

- * Enhance detection accuracy and sensitivity to anomalies.
- * Assist analysts in identifying hidden patterns that traditional rule-based systems miss.
- * Augment-not replace-human decision-making for high-confidence outcomes.

Options B and C incorrectly shift responsibility entirely to AI, which contradicts governance principles requiring human oversight.

Option D is useful for efficiency, but the primary effectiveness comes from improving detection quality.

Therefore, the most effective use is to reduce false negatives and detect subtle attacks.

NEW QUESTION # 28

Which of the following metrics BEST evaluates the ability of a model to correctly identify all true positive instances?

- A. Specificity
- B. F1 score
- C. Precision
- **D. Recall**

Answer: D

Explanation:

AAISM technical coverage identifies recall as the metric that specifically measures a model's ability to capture all true positive cases out of the total actual positives. A high recall means the system minimizes false negatives, ensuring that relevant instances are not overlooked. Precision instead measures correctness among predicted positives, specificity focuses on true negatives, and the F1 score balances precision and recall but does not by itself indicate the completeness of capturing positives. The official study guide defines recall as the most direct metric for evaluating how well a model identifies all relevant positive cases, making it the correct answer.

NEW QUESTION # 29

Which of the following is the MOST important consideration for an organization that has decided to adopt AI to leverage its competitive advantage?

- A. Develop internal training programs on AI governance, risk, and compliance (GRC)
- B. Develop a comprehensive risk management process to address AI-related issues
- C. Develop a business case for the procurement of AI monitoring tools
- **D. Develop a comprehensive strategic roadmap for AI integration**

Answer: D

Explanation:

AAISM's governance guidance emphasizes that adopting AI for competitive advantage must begin with a comprehensive strategic roadmap for integration. This roadmap aligns AI adoption with business objectives, sets priorities, defines milestones, and ensures coordination across functions. Risk management, training, and tool procurement are essential, but they are tactical steps that follow once the strategic direction is defined.

Without a roadmap, adoption becomes fragmented and risks misalignment with business strategy. The most important consideration at the adoption stage is therefore creating a strategic integration roadmap.

NEW QUESTION # 30

In a new supply chain management system, AI models used by participating parties are interactively connected to generate advice in support of management decision making. Which of the following is the GREATEST challenge related to this architecture?

- A. Explaining the overall benefit of the system to stakeholders
- B. Identifying hallucinations returned by AI models
- C. Determining the aggregate risk of the system
- **D. Establishing clear lines of responsibility for AI model outputs**

Answer: D

Explanation:

The AAISM governance framework notes that in multi-party AI ecosystems, the greatest challenge is ensuring clear accountability for AI outputs. When models from different parties interact, responsibility for errors, bias, or harmful recommendations can be unclear, leading to disputes and compliance gaps. While aggregate risk assessment and error identification are significant, they are secondary to the fundamental governance requirement of establishing transparent lines of responsibility. Without defined accountability, no stakeholder can reliably manage or mitigate risks. Therefore, the greatest challenge in such a distributed architecture is responsibility for AI outputs.
