Candidates can also benefit from taking online courses or attending in-person training sessions to gain a better understanding of the exam's content and format. Ultimately, the Salesforce PDII Certification offers a unique opportunity for developers to demonstrate their skills and expertise in Salesforce development and advance their careers in this fast-growing industry.

Salesforce Certified Platform Developer II (PDII) Sample Questions (Q57-Q62):

NEW QUESTION # 57
Consider the below trigger intended to assign the Account to the manager of the Account's region:

```
trigger AssignOwnerByRegion on Account ( before insert, before update )
{
    List<Account> accountList = new List<Account>();
    for( Account anAccount : trigger.new )
    {
        Region__c theRegion = [
            SELECT id, Name, Region_Manager__c
            FROM Region__c
            WHERE Name = :anAccount.Region_Name__c
        ];
        anAccount.OwnerId = theRegion.Region_Manager__c;

        accountList.add( anAccount );
    }

    update accountList;
}
```

Which two changes should a developer make in this trigger to adhere to best practices?
Choose 2 answers

- A. Add if (Trigger.isInsert || Trigger.isUpdate) before update accountList.
- B.
- C. Use a Map to cache the results of the Region__c query by Id.
- D. Move the Region__c query to outside the loop.

Answer: C,D

Explanation:

The best practices for writing triggers in Salesforce include bulkifying your code to handle multiple records efficiently and reducing the number of SOQL queries, especially within loops, to avoid hitting governor limits.

Option B is correct because moving the SOQL query outside of the for loop is essential to bulkify the trigger. Performing a query within a loop can cause a SOQL governor limit to be reached if the trigger is processing many records. The best practice is to collect all necessary data before the loop starts and then process it within the loop.

Option C is correct as well, because using a Map to cache the results of a SOQL query by Id is another way to bulkify the code. This allows you to query all the necessary data once and then access it efficiently in memory, avoiding repeated queries.

Option A is incorrect because adding isExecuting before the update doesn't address any best practices related to bulkification or SOQL query optimization.

Option D is incorrect because the last line should not be removed if the developer intends to perform DML on the accountList. However, this line should be outside of the loop and is unnecessary if the trigger context is 'before insert' or 'before update', since in those contexts, changes to records in Trigger.new are implicitly saved without the need for explicit DML.

NEW QUESTION # 58

A developer receives a LimitException: Too many query rows: 50001 error when running code. What debugging approach using the Developer Console provides the fastest and most accurate mechanism to identify a specific component that may be returning an unexpected number of rows?

- A. Add System.debug (System.getoueryRows ()) to the code to track SOQL usage.
- B. Count the number of Row Limit warning messages in the Debug Logs.
- C. Filter the Debug Log on SOQL_EXECUTE_END statements to track the results of each SOQL Query.
- D. Use the Execution Overview to see the number of rows returned by each Executed Unit.

Answer: C

NEW QUESTION # 59

A developer is building a Lightning web component that searches for Contacts. The component must communicate the search results to other unrelated Lightning web components, that are in different DOM trees, when the search completes.

What should the developer do to implement the communication?

- A. Fire an application event.
- B. Publish an event on an event channel.
- C. Fire a custom component event.
- D. Publish a message on a message channel.

Answer: D

NEW QUESTION # 60

A company manages information about their product offerings in custom objects named Catalog and Catalog Item. Catalog Item has a master-detail field to Catalog, and each Catalog may have as many as 100,000 Catalog Items.

Both custom objects have a CurrencylsoCode text field that contains the currency code they should use. If a Catalog's CurrencylsoCode changes, all of its Catalog Items' CurrencylsoCodes should be changed as well.

What should a developer use to update the CurrencylsoCodes on the Catalog Items when the Catalog's CurrencylsoCode changes?

- A. An after insert trigger on Catalog that updates the Catalog Items if the Catalogs CurrencylsoCode is different
- B. A Database.Schedulable and Database.Batchacle class that queries the Catalog Item object and updates the Catalog Items if the Catalog CurrencylSoCode is different
- C. An after insert trigger on Catalog Item that updates the Catalog Items if the Catalog's CurrencylsoCode is different
- D. A Database. schedulable and Dazabase.Bazchacle class that queries the Catalog object and updates the Catalog Items if the Catalog CurrencylSoCode is different

Answer: B

Explanation:
A Database.Schedulable and Database.Batchable class is the best option to update the CurrencyIsoCodes on the Catalog Items when the Catalog's CurrencyIsoCode changes. This is because the Catalog Item object may have a large number of records (up to 100,000) and updating them in a trigger may hit governor limits or cause performance issues. A batch class can process the records in batches and a schedulable class can run the batch class at a specified time or frequency. The batch class should query the Catalog Item object and update the Catalog Items if the Catalog CurrencyIsoCode is different from the Catalog Item CurrencyIsoCode. Reference: [Database.Schedulable Interface], [Database.Batchable Interface], [Using Batch Apex], [Scheduling Apex]

NEW QUESTION # 61
messages are rendering on the page. Which component should be added to the Visualforce page to display the message?

- A.
  `<apex:pageMessage severity="info" />`

- B.
  `<apex:pageMessages />`

- C.
  `<apex:message for="info"/>`

- D.
  `<apex:facet name="messages" />`

Answer: B

NEW QUESTION # 62
