So know more about our AWS-DevOps study guide right now!

Amazon AWS Certified DevOps Engineer - Professional Sample Questions (Q531-Q536):

NEW QUESTION # 531

You manage a three-tier web application consisting of an autoscaled web proxy tier, an autoscaled application tier, and an Amazon RDS database tier.

You use a load balancer to distribute requests from end users to the web proxy tier and another, internal load balancer to distribute requests between the web tier and the application tier.

After deploying a small database schema update, you notice that all of your web and application instances have been terminated. What may have caused this?

- A. Your load balancers use an HTTP health check, and the page relies on retrieving data from your database.
- B. Your load balancer use TCP health checks to provide application-level health checks.
- C. Your Auto Scaling group health check type is set to "EC2" to check that the instances themselves are healthy.
- D. The cooldown period of the Auto Scaling group is too short, so the instances don't have enough time to recover from an issue.

Answer: A

NEW QUESTION # 532

What needs to be done in order to remotely access a Docker daemon running on Linux?

- A. change the encryption level to TLS
- B. add certificate authentication to the docker API
- C. enable the TCP socket
- D. bind the Docker API to a unix socket

Answer: C

Explanation:

The Docker daemon can listen for Docker Remote API requests via three different types of Socket: unix, tcp, and fd.

By default, a unix domain socket (or IPC socket) is created at /var/run/docker.sock, requiring either root permission, or docker group membership. If you need to access the Docker daemon remotely, you need to enable the tcp Socket. Beware that the default setup provides un- encrypted and un-authenticated direct access to the Docker daemon - and should be secured either using the built in HTTPS encrypted socket or by putting a secure web proxy in front of it.

Reference:

<https://docs.docker.com/engine/reference/commandline/dockerd/#daemon-socket-option>

NEW QUESTION # 533

If Ansible encounters a resource that does not meet the requirements specified in the play it makes the necessary changes to the resource; however if the resource is already in the desired state Ansible will do nothing. This is an example of which methodology?

- A. Infrastructure as Code
- B. Idempotency
- C. Immutability
- D. Convergence

Answer: B

Explanation:

Idempotency states that changes are only made if a resource does not meet the requirement specifications. If a change is made, it is made 'in-place' and will not break existing resources.

Reference: <http://docs.ansible.com/ansible/glossary.html>

NEW QUESTION # 534

When building a multicontainer Docker platform using Elastic Beanstalk, which of the following is required

- A. DockerFile to create custom images during deployment
- B. RedHatOpensift to manage the docker containers.
- C. Kurbemetes to manage the docker containers.
- D. Prebuilt Images stored in a public or private online image repository.

Answer: D

Explanation:

Explanation

This is a special note given in the AWS Documentation for Multicontainer Docker platform for Elastic Beanstalk Building custom images during deployment with a Dockerfile is not supported by the multicontainer Docker platform on Elastic Beanstalk. Build your images and deploy them to an online repository before creating an Elastic Beanstalk environment.

For more information on Multicontainer Docker platform for Elastic Beanstalk, please refer to the below link:

* http://docs.aws.amazon.com/elasticbeanstalk/latest/dg/create_deploy_docker_ecs.

* html

NEW QUESTION # 535

Which of the following can be used in CloudFormation to coordinate the creation of stack resources. Choose 2 answers from the options given below

- A. HoldPolicyattribute
- B. CreationPolicyattribute
- C. AWS::CloudFormation::HoldCondition
- D. AWS::CloudFormation::WaitCondition

Answer: B,D

Explanation:

Explanation

The AWS Documentation mentions the following

Using the AWS::CloudFormation::WaitCondition resource and Creation Policy attribute, you can do the following:

Coordinate stack resource creation with other configuration actions that are external to the stack creation Track the status of a configuration process For more information on wait conditions, please refer to the below link:

* <http://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/using-cfn-waitcondition.html>

NEW QUESTION # 536

.....
