Palo Alto Networks Certified Network Security Engineer Exam Sample Questions (Q268-Q273):

NEW QUESTION # 268

What is the function of a service route?

- A. The service route is the method required to use the firewall's management plane to provide services to applications
- **B. Service routes provide access to external services such as DNS servers external authentication servers or Palo Alto Networks services like the Customer Support Portal**
- C. The service packets enter the firewall on the port assigned from the external service. The server sends its response to the configured destination interface and destination IP address
- D. The service packets exit the firewall on the port assigned for the external service. The server sends its response to the configured source interface and source IP address

Answer: B

Explanation:

Explanation

A service route is the path from an interface on the firewall to a service on a server. Service routes provide access to external services such as DNS servers, external authentication servers or Palo Alto Networks services like the Customer Support Portal1. By default, the firewall uses the management (MGT) interface to access these services, but you can configure a data port (a regular interface) as an alternative2. A service route is not related to the firewall's management plane or the port assigned for the external service. A service route does not affect how the server sends its response to the firewall.
