Try Docker DCA Questions To Clear Exam in First Endeavor

Are you worried about your poor life now and again? Are you desirous to gain a decent job in the near future? Do you dream of a better life? Do you want to own better treatment in the field? If your answer is yes, please prepare for the DCA exam. It is known to us that preparing for the exam carefully and getting the related certification are very important for all people to achieve their dreams in the near future. It is a generally accepted fact that the DCA Exam has attracted more and more attention and become widely acceptable in the past years.

Docker Certified Associate (DCA) certification exam is a popular certification for IT professionals who work with Docker container technology. Docker is a popular platform for building, shipping, and running distributed applications. The DCA certification is designed to validate the skills and knowledge of an individual in Docker container technology. DCA Exam measures the knowledge of the candidates in various areas such as Docker architecture, installation and configuration, Docker networking, security, and troubleshooting.

Docker Certified Associate (DCA) Exam Sample Questions (Q169-Q174):

NEW QUESTION # 169

Is this an advantage of multi-stage builds?

Solution: better caching when building Docker images

- **A. Yes**
- B. No

Answer: A

Explanation:

Explanation

Better caching when building Docker images is an advantage of multi-stage builds. Multi-stage builds allow you to use multiple FROM statements in your Dockerfile, each starting a new stage of the build¹. This can help you improve the caching efficiency of your Docker images, as each stage can use its own cache layer². For example, if you have a stage that installs dependencies and another stage that compiles your code, you can reuse the cached layer of the dependencies stage if they don't change, and only rebuild the code stage if it changes². This can save you time and bandwidth when building and pushing your images. References:

* Multi-stage builds | Docker Docs

* What Are Multi-Stage Docker Builds? - How-To Geek

NEW QUESTION # 170

You are troubleshooting a Kubernetes deployment called api, and want to see the events table for this object.

Does this command display it?

Solution: kubectl describe deployment api

- **A. Yes**
- B. No

Answer: A

Explanation:

Explanation

Using kubectl describe deployment api displays the events table for this object. The kubectl describe command shows detailed information about a resource, including its status and events. This command can be used to troubleshoot a deployment that is not working as expected. References:

<https://kubernetes.io/docs/reference/generated/kubectl/kubectl-commands#describe>

NEW QUESTION # 171

From a DevOps process standpoint, it is best practice to keep changes to an application in version control. Which of the following will allow changes to a docker Image to be stored in a version control system?

- A. docker commit
- B. A docker-compose.yml file
- C. docker save
- D. A dockerfile

Answer: A

NEW QUESTION # 172

A Kubernetes node is allocated a /26 CIDR block (64 unique IPs) for its address space.

If every pod on this node has exactly two containers in it, how many pods can this address space support on this node?

- A. 0
- B. 1
- C. 64 for every service routing to pods on this node
- D. 2
- E. 32 in every Kubernetes namespace

Answer: B

Explanation:

A Kubernetes node is allocated a /26 CIDR block (64 unique IPs) for its address space. This means that the node can assign up to 64 IP addresses to its resources, such as pods and containers. If every pod on this node has exactly two containers in it, then each pod will need two IP addresses, one for each container. Therefore, the node can support up to 32 pods, since $64 / 2 = 32$. The other options are incorrect because they either exceed the available IP addresses or do not account for the number of containers per pod. References:

*CIDR Blocks and Container Engine for Kubernetes - Oracle

*How kubernetes assigns podCIDR for nodes? - Stack Overflow

NEW QUESTION # 173

Is this a type of Linux kernel namespace that provides container isolation?

Solution.Process ID

- A. Yes
- B. No

Answer: A

Explanation:

Explanation

Process ID is a type of Linux kernel namespace that provides container isolation. Linux namespaces are a feature of the Linux kernel that isolate and virtualize system resources of a collection of processes¹. Process ID namespace isolates the process ID number space, meaning that processes in different PID namespaces can have the same PID². This allows each container to have its own init process with PID 1, which is the ancestor of all other processes in the container³. Process ID namespace also affects other identifiers, such as thread IDs, parent process IDs, and session IDs⁴. References: Namespaces in operation), pid_namespaces), What is a PID namespace?, Linux Namespaces: PID)
