For robust security in SAP integration landscapes:
A security architecture must cover:
Authentication # Verifying the identity of users/systems (OAuth 2.0, SAML, certificates).
Authorization # Role-based access control.
Encryption # TLS/SSL for data in transit, strong encryption for data at rest.
This ensures end-to-end security without sacrificing performance or scalability.

Other options:

Skilled teams and security patches are important but are operational measures, not the foundation of integration security.
